Manly,L. McDonald,D.L. Thomas,2012-12-06 We have written this book as a guide to the design and analysis of field studies of resource selection concentrating primarily on statistical aspects of the comparison of the use and availability of resources of different types Our intended audience is field ecologists in general and wildlife biologists in particular who are attempting to measure the extent to which real animal populations are selective in their choice of food and habitat As such we have made no attempt to address those aspects of theoretical ecology that are concerned with how animals might choose

their resources if they acted in an optimal manner The book is based on the concept of a resource selection function where this is a function of characteristics measured on resource units such that its value for a unit is proportional to the probability of that unit being used We argue that this concept leads to a unified theory for the analysis and interpretation of data on resource selection and can replace many ad hoc statistical methods that have been used in the past **Applied**

**Landscapes** Joshua Millsaugh, Frank R. Thompson,2011-04-28 A single resource volume of information on the most current and effective techniques of wildlife modeling Models for Planning Wildlife Conservation in Large Landscapes is appropriate

for students and researchers alike The unique blend of conceptual methodological and application chapters discusses research applications and concepts of modeling and presents new ideas and strategies for wildlife habitat models used in conservation planning The book makes important contributions to wildlife conservation of animals in several ways 1 it highlights historical and contemporary advancements in the development of wildlife habitat models and their implementation in conservation planning 2 it provides practical advice for the ecologist conducting such studies and 3 it supplies directions for future research including new strategies for successful studies Intended to provide a recipe for successful development of wildlife habitat models and their implementation in conservation planning the book could be used in studying wildlife habitat models conservation planning and management techniques Additionally it may be a supplemental text in courses dealing with quantitative assessment of wildlife populations Additionally the length of the book would be ideal for graduate student seminar course Using wildlife habitat models in conservation planning is of considerable interest to wildlife biologists With ever tightening budgets for wildlife research and planning activities there is a growing need to use computer methods Use of simulation models represents the single best alternative However it is imperative that these techniques be described in a single source Moreover biologists should be made aware of alternative modeling techniques It is also important that practical guidance be provided to biologists along with a demonstration of utility of these procedures Currently there is little guidance in the wildlife or natural resource planning literature on how best to incorporate wildlife planning activities particularly community based approaches Now is the perfect time for a syntheistic publication that clearly outlines the concepts and available methods and illustrates them Only single resource book of information not only on various wildlife modeling techniques but also with practical guidance on the demonstrated utility of each based on real world conditions Provides concepts methods and applications for wildlife ecologists and others within a GIS context Written by a team of subject area experts
