PRINCIPLES OF OPERATION

The secret used for this Metal Detector is a simple form of resonance. The transmitter and receiver are inductively coupled in two coils wound inside the search loop. You will adjust the controls to inductively balance the receiver circuit to the transmitter coil. When a ferrous or non-ferrous metallic object is introduced into the electromagnetic field set up by the transmitter coil, an unbalanced state will result between transmitter and receiver coils. The receiver section detects the unbalanced condition, resulting in a change in audio level from the speaker, plus a meter reading.

Detection of Ferrous vs Non-Ferrous Metals

When a metallic object is introduced into the electromagnetic field of the loop, one of two reactions will occur. The result depends entirely on the type of metallic material — ferrous or non-ferrous. Magnetic lines of force from the field, which meet a metallic object, will induce a secondary electromagnetic field around the object. This "secondary" field either aids or opposes the main field — depending upon the object's magnetic properties. With two reactions possible (aiding, one aiding, it stands to reason two different indications are possible from the Speaker or on the Meter.

Examples of non-ferrous metals are gold, silver, copper, platinum, aluminum, lead, zinc, etc. Ferrous metals are those which contain iron in some form.

Thus, after setting the DISCRIMINATOR Control to Discrimination mode, you can determine if you are detecting a ferrous or non-ferrous metal object just by interpreting the Speaker's sound change and/or the Meter reading.

This ability to distinguish between ferrous and non-ferrous metals is a major advantage of your MICRONTECH Metal Detector. As you become an experienced treasure hunter, you'll greatly appreciate this special feature.
