J. McCaffrey, 2013-11-11 The growth of clinical neuropsychology has been unprecedented This growth has been oriented more toward the provision of than toward the foundation for services Thus while a greater number of psychologists are performing a greater number of neuropsychological procedures there seems to us an uneven parallel growth between these services and the empirical foundations for them It should come to no one's surprise that increasingly aggressive attacks on the field have been leveled Despite these attacks clinical neuropsychology continues to enjoy exceptional growth within psychology and acceptance by other health practitioners insurance companies legislators judges juries and above all consumers of our services Growth without self reflection is a dangerous enterprise as is growth without directions We find it disconcerting that existing and limited self analysis has assumed that neuropsychological dysfunction is immune to the same variables that affect psychological dysfunction Some attention has been paid to the most obvious ones such as age but all others have been ignored and or misunderstood This neglect has spawned a body of knowledge replete with questionable data and unfounded conclusions Hence it is surprising that clinical neuropsychologists consider themselves to be more scientifically sound than their regular clinical counterparts

Neoconstructivism Scott Johnson, 2010 Arguments over the developmental origins of human knowledge are ancient founded in the writings of Plato Aristotle Descartes Hume and Kant They have also persisted long enough to become a core area of inquiry in cognitive and developmental science Empirical contributions to these debates however appeared only in the last century when Jean Piaget offered the first viable theory of knowledge acquisition that centered on the great themes discussed by Kant object space time and causality The essence of Piaget's theory is constructivism The building of concepts from simpler perceptual and cognitive precursors in particular from experience gained through manual behaviors and observation The constructivist view was disputed by a generation of researchers dedicated to the idea of the competent infant endowed with knowledge say of permanent objects that emerged prior to facile manual behaviors Taking this possibility further it has been proposed that many fundamental cognitive mechanisms reasoning event prediction decision making hypothesis testing and deduction operate independently of all experience and are in this sense innate The competent infant view has an intuitive appeal attested to by its widespread popularity and it enjoys a kind of parsimony It avoids the supposed philosophical pitfall posed

by having to account for novel forms of knowledge in inductive learners But this view leaves unaddressed a vital challenge to understand the mechanisms by which new knowledge arises This challenge has now been met The neoconstructivist approach is rooted in Piaget s constructivist emphasis on developmental mechanisms yet also reflects modern advances in our understanding of learning mechanisms cortical development and modeling This book brings together for the first time theoretical views that embrace computational models and developmental neurobiology and emphasize the interplay of time experience and cortical architecture to explain emergent knowledge with an empirical line of research identifying a set of general purpose sensory perceptual and learning mechanisms that guide knowledge acquisition across different domains and through development
