Kastning,2013-11-11 Integer Prograw ing is one of the most fascinating and difficult areas in the field of Mathematical Optimization Due to this fact notable research contributions to Integer Programming have been made in very different branches of mathematics and its applications Since these publications are scattered over many journals proceedings volumes monographs and working papers a comprehensive bibliography of all these sources is a helpful tool even for specialists in this field I initiated this compilation of literature in 1970 at the Institut fur konometrie und Operations Research University of Bonn Since then many collaborators have contributed to and worked on it Among them Dipl Math Claus Kastning has done the bulk of the work With great perseverance and diligence he has gathered all the material and checked it with the original sources The main aim was to incorporate rare and not easily accessible sources like Russian journals preprints or unpublished papers Without the invaluable and dedicated engagement of Claus Kastning the bibliography would never have reached this final version For this reason he must be considered its responsible editor As with any other collection this literature list has a subjective viewpoint and may be in some sense incomplete We have however tried to be as complete as possible The bibliography contains 4704 different publications by 6767 authors which were classified by 11839 descriptor entries **Computer Methods in Operations Research** Arne Thesen,2014-05-10 Computer Methods in Operations Research focuses on the computational methods used in operations research Topics covered range from list processing to sorting and searching networks and critical path methods Resource constrained scheduling methods and linear programming methods are also discussed along with the branch and bound concept Comprised of 11 chapters this book begins with a review of some of the basic principles that make a software development effort successful emphasizing the need to keep things simple and understandable The reader is then introduced to the basic principles of list processing searching and sorting the concept of networks and several matrix and list oriented methods for representing networks in the computer and the critical path method Subsequent chapters deal with more complex programs and algorithms to handle scheduling of activities under precedence and resource restrictions the resource constrained scheduling problem formulated both in an exact using integer programming and in a heuristic manner the design of algorithms for the solution of large linear programming problems and the application of list processing concepts to the development of branch and bound algorithms for solution of combinatorial optimization problems The book also considers the design of random number generators and discrete event simulation programming before concluding with a description of two programming languages GPSS and WIDES for use in simulation modeling This monograph will be of value to students and practitioners of operations research and industrial engineering
