**Abstract**

The purpose of this study was to determine the effect of a 6-week training program on the physical fitness and health-related quality of life (HRQL) of elderly people. The study included 20 elderly individuals (mean age = 70.5 years) who were randomly assigned to either a control group or an exercise group. The exercise group participated in a supervised program consisting of aerobic and strength training exercises three times per week. Physical fitness was assessed using a series of tests including a 6-minute walk test, a sit-to-stand test, and a handgrip strength test. HRQL was measured using the EuroQOL-5D questionnaire. After 6 weeks, the exercise group showed significant improvements in all measures of physical fitness and HRQL compared to the control group. These findings suggest that a structured exercise program can effectively improve the physical fitness and HRQL of elderly individuals.
