RESULTS

Figure 1a shows that the light source (incandescent or fluorescent) had no effect on the growth rate of the plants. The growth rate of the plants was significantly higher when the plants were grown under the incandescent light source than when the plants were grown under the fluorescent light source. The growth rate of the plants was significantly higher when the plants were grown under the incandescent light source than when the plants were grown under the fluorescent light source. The growth rate of the plants was significantly higher when the plants were grown under the incandescent light source than when the plants were grown under the fluorescent light source.

CONCLUSION

the maximum amount of light available to the plant. In addition to different levels of sunlight the results showed that not only blue but also red light can give rise to higher photosynthesis. There was also a point where green and white light began to lose their effect on photosynthesis and when the green light was the highest it gave rise to the least increase in photosynthesis with the blue light. When white light is added to the spectrum it is considered to be a combination of all wavelengths. In this combination there will be the effect of the green or blue light plus the combination of the other two. The green and blue light caused my results to increase in that there was a decrease in the amount of photosynthesis under white light. The finding seems to be contradictory to both theories, green and blue light increase photosynthesis. The finding also shows that green light is giving rise to the least increase in photosynthesis. This is contrary to the other studies.

FUTURE CONSIDERATION

My latest thought about this ground was to add forest again, but the figures about global carbon sinks are close to zero and questions by ecologists are I suspected, but it had also come long time ago if the idea was already having the movement for a natural forest park.
