Mercury Division, 1946 *VAX MERCURY User's Manual* Jed E. Marquart, WRIGHT RESEARCH AND DEVELOPMENT CENTER WRIGHT-PATTERSON AFB OH., 1990 This report describes the use and operation of the MERCURY flow solver code on the Digital Equipment VAX series of computers MERCURY is a multiple grid block flow solver which solves the Euler set of equations inviscid flow The MERCURY code was developed and written by William Z Strang of WRDC FIMM for use on the CRAY Supercomputer reference Appendix D As such it was optimized to take full advantage of CRAY specific I O routines which greatly reduce the I O time required Since a large percentage of execution time is spent in the I O process when using a multiblock code such as this the optimization of the I O process is essential to achieving acceptable turnaround times for the solution In addition to the CRAY specific I O routines MERCURY was developed using one dimensional arrays to reduce memory overhead and improve vectorization While the optimization of the I O routines for operation on the CRAY makes MERCURY an extremely fast code it also makes the code much less portable Other machines do not permit the type of I O which makes the CRAY so desirable Thus when it is desired to convert the code

to run on another host machine the I O routines must be changed to work on the new host while still maintaining the correct data structure and logical order kr **Project Mercury Familiarization Manual** United States.
