*Computational Methods for Electron—Molecule Collisions* Franco A. Gianturco, W.M. Huo, 2013-06-29 The collision of electrons with molecules and molecular ions is a fundamental process in atomic and molecular physics and in chemistry At high incident electron energies electron molecule collisions are used to deduce molecular geometries oscillator strengths for optically allowed transitions and in the case of electron impact ionization to probe the momentum distribution of the molecule itself When the incident electron energy is comparable to or below those of the molecular valence electrons the physics involved is particularly rich Correlation and exchange effects necessary to describe such collision processes bear a close resemblance to similar effects in the theory of electronic structure in molecules Compound state formations in the form of resonances and virtual states manifest themselves in experimental observables which provide details of the electron molecule interactions Rotational excitations by low energy electron collisions exemplify energy transfer between the electronic and nuclear motion The role of nonadiabatic interaction is raised here When the final vibrational state is in the continuum molecular dissociation occurs Dissociative recombination and dissociative attachment are examples of such fragmentation processes In addition to its fundamental nature the study of electron molecule collisions is also motivated by its relation to other fields of study and by its technological applications The study of planetary atmospheres and the interstellar medium necessarily involve collision processes of electrons with molecules and molecular ions

### **Generalized Bounds for Convex Multistage Stochastic Programs**

Daniel Kuhn,2006-03-30 This work was completed during my tenure as a scientific assistant and doctoral student at the Institute for Operations Research at the University of St Gallen During that time I was involved in several industry projects in the field of power management on the occasion of which I was repeatedly confronted with complex decision problems under uncertainty Although usually hard to solve I quickly learned to appreciate the benefit of stochastic programming models and developed a strong interest in their theoretical properties Motivated both by practical questions and theoretical concerns I became particularly interested in the art of finding tight bounds on the optimal value of a given model The present work attempts to make a contribution to this important branch of stochastic optimization theory In particular it aims at extending some classical bounding methods to broader problem classes of practical relevance This book was accepted as a doctoral thesis by the University of St Gallen in June 2004 I am particularly indebted to Prof Dr Karl Frauendorfer for supervising my work I am grateful for his kind support in many respects and the generous freedom I received to pursue my own ideas in research My gratitude also goes to Prof Dr Georg Pflug who agreed to co chair the dissertation committee With pleasure I express my appreciation for his encouragement and continuing interest in my work

**Clear and Approximate Categorization** Hélène Vassiliadou,Marie Lammert,2022-11-07 In recent decades research on clear and approximate categorizations and their manifestations in language has been generating a number of studies on syntax semantics pragmatics psycholinguistics philosophy and logic This is particularly interesting because these two operations have formally similar realizations even in languages belonging to different groups The existence of a large number of type nouns testifies to their productivity If these nouns serve to both categorize and approximate the fundamental question is that of identifying the processes of interpretation concerned since there is not always a consensus on interpretation This book makes it clear that there are different ways to reach the category associated with a word by putting into perspective the issues surrounding the categorization and approximation and by comparing the ways of expression in languages belonging to different language groups All in all by investigating syntactic morphological and semantic correlations between type noun

binominals and other constructions in various languages this volume will provide an overview of the current state of research on the subject in order to help scholars and students to grasp the meaning and the cognitive foundations of approximation and categorization The functioning of each language might clarify the links between categorization and approximation two often opposed yet essentially indissociable operations
