**Flat-Panel Displays and CRTs** Lawrence E. Tannas, 2012-12-06 Flat Panel Displays and CRTs a review of electronic information display devices is the first systematic and comprehensive coverage of the subject It is intended to distill our wealth of knowledge of flat panel displays and CRTs from their beginnings to the present state of the art Historical perspective theory of operation and specific applications are all thoroughly covered The field of display engineering is a multidisciplinary technical pursuit with the result that its individual disciplines suffer from a lack of communications and limited perspective Many previously developed standards for and general understanding of one technology are often inappropriate for another Care has been taken here to document the old incorporate the new and emphasize commonalities Criteria for performance have been standardized to enable an expert in one display technology such as liquid crystals to compare his device performance with that offered by another technology such as electroluminescence This book has been written with a second purpose in mind to wit to be the vehicle by means of which a new scientist or engineer can be introduced into the display society It is organized to be tutorial for use in instructional situations The first chapters begin with first principles and definitions the middle chapters set out requirements and criteria and the last chapters give a complete description of each major technology

**The TVs of Tomorrow** Benjamin Gross,2018-03-22 In 1968 a team of scientists and engineers from RCA announced the creation of a new form of electronic display that relied upon an obscure set of materials known as liquid crystals At a time when televisions utilized bulky cathode ray tubes to produce an image these researchers demonstrated how liquid crystals could electronically control the passage of light One day they predicted liquid crystal displays would find a home in clocks calculators and maybe even a television that could hang on the wall Half a century later RCA's dreams have become a reality and liquid crystals are the basis of a multibillion dollar global industry Yet the company responsible for producing the first LCDs was unable to capitalize upon its invention In *The TVs of Tomorrow* Benjamin Gross explains this contradiction by examining the history of flat panel display research at RCA from the perspective of the chemists physicists electrical engineers and technicians at the company's central laboratory in Princeton New Jersey Drawing upon laboratory notebooks internal reports and interviews with key participants Gross reconstructs the development of the LCD and situates it alongside other efforts to create a thin lightweight replacement for the television picture tube He shows how RCA researchers mobilized their technical expertise to secure support for their projects He also highlights the challenges associated with the commercialization of liquid crystals at RCA and Optel the RCA spin off that ultimately manufactured the first LCD wristwatch *The TVs of Tomorrow* is a detailed portrait of American innovation during the Cold War which confirms that success in the electronics industry hinges upon input from both the laboratory and the boardroom

Françoise Pardos,2004 Flexible films are defined as being planar forms of plastics which may be thick enough to be self  
supporting but thin enough to be flexed folded and or creased without cracking Films comprise around 25 per cent of all  
plastics used worldwide around 40 million tons and are thus a massive market sector Commodity plastics dominate with  
polyethylene and polypropylene together accounting for around 34 million tons This is an expanding area with increased  
demand each year particularly in the developing regions of the world and with a move from rigid to flexible packaging There  
are many material types used in films from single layer polymers to multilayer structures with tie layers and copolymers  
Multilayers permit custom adaptation of material properties from barrier to strength Technology such as the orientation of  
polypropylene has produced better properties and more valuable materials High performance plastics are also being used in  
applications such as teletronics There are details of the main suppliers including mergers and capacity coextrusion casting  
extrusion coating extrusion laminating and metallising Blown extrusion was the first process used to make films of  
polyethylene These processes have advantages and disadvantages depending on the material type in use the width and  
thickness of film required Films are mainly used in packaging for foodstuffs but there are also substantial market segments  
for medical electronic automotive and construction applications Specific applications include decorative wrap form fill seal  
blood bags flexible printed circuits bed sheeting diapers and in mould decorating of car parts to replace painting and provide  
a more durable surface coating Carrier bags and garbage bags are big markets with imports to Europe there are  
environmental concerns about the use of plastic bags and these are discussed in the report geomembranes and similar  
applications PE and PP are the main materials used in packaging films PET is primarily used in magnetics optics and  
teletronics PVC is found in consumer goods and medical applications while PVB is mainly used in automotive and  
construction applications as glazing protection Multimaterial films account for around 7 million tons of the films produced  
with around 95 per cent of this going into packaging applications These are just some of the examples listed in this market  
report Europe and North America each account for about 30 per cent of the total world consumption of plastic films The  
plastic films supply structure and individual company information are summarised in the second half of this market report on
