Flare Observations in the IRIS Era: What Have We Learned, and What's Next? Vanessa Polito, Bart de Pontieu, Adam Kowalski, Viggo Hansteen, 2023-12-27 Since its launch in 2013 IRIS has observed more than 10 X class over 100 M class and more than 600 C class flares at unprecedented spatial and temporal resolution Thanks to the rich diagnostics that cover the physical conditions of the solar atmosphere from the photosphere to the hottest parts of the flaring corona IRIS observations have provided exciting new results and constraints on flare heating models significantly expanding our knowledge of how flares are triggered and how the non thermal energy is released propagates downward from the corona and is deposited in the low atmosphere At the same time the new discoveries provided by IRIS have raised new unresolved questions and new challenges for theoretical models For instance current hydrodynamic models still cannot fully explain many features observed by IRIS during both the impulsive and gradual phases such as the dynamics of the evaporative condensation flows the large line broadenings and the puzzling complex and broad chromospheric lines In addition important questions remain regarding the details of the energy propagation and dissipation in flares the importance of Alfvén waves vs electron beam and thermal conduction heating and the effects from large scale reconfiguration of the magnetic field during flares

Active Global Seismology Ibrahim Cemen, Yucel Yilmaz, 2017-03-03 Neotectonics involves the study of the motions and deformations of the

Earth's crust that are current or recent in geologic time. The Mediterranean region is one of the most important regions for neotectonics and related natural hazards. This volume focuses on the neotectonics of the Eastern Mediterranean region which has experienced many major extensive earthquakes including the devastating Izmit Turkey earthquake on August 17, 1999. The event lasted for 37 seconds, killing around 17,000 people, injuring 44,000 people, and leaving approximately half a million people homeless. Since then, several North American, European, and Turkish research groups have studied the neotectonics and earthquake potential of the region using different geological and geophysical methods including GPS studies, geodesy, and passive source seismology. Some results from their studies were presented in major North American and European geological meetings. This volume highlights the work involving the Eastern Mediterranean region which has one of the world's longest and best studied active strike-slip horizontal motion faults, the east-west trending North Anatolian fault zone, which is very similar to the San Andreas fault in California. This volume features discussions of widespread applications in measuring plate motion that have strong implications in predicting natural disasters like earthquakes both on a regional and a global scale. Recent motions, particularly those produced by earthquakes, provide insights on the physics of earthquake recurrence, the growth of mountains, orogenic movements, and seismic hazards. Unique methodical approaches in collecting tectonophysical data, including field seismic, experimental, computer-based, and theoretical approaches. Active Global Seismology is a valuable resource for geoscientists, particularly in the field of tectonophysics, geophysics, geodynamics, seismology, structural geology, environmental geology, and geoengineering.
