

4. Securely connect an ammeter between the main output terminal post of the alternator and the output lead (negative side to lead).
5. Re-connect the battery earth cable and connect a variable load resistor, with the slider in the minimum current draw position (maximum resistance), across the battery terminals.
6. Start the engine and increase the speed to 2000 rev/min.
7. Slowly increase the current loading of the resistor (decrease resistance) until the ammeter registers 65 amperes.
8. Observe the millivoltmeter reading which should not exceed 400 millivolts.

If the reading is in excess of 400 millivolts, a high resistance fault is indicated in the external circuitry.

If the required alternator output cannot be achieved, and the millivoltmeter reading is less than 400 millivolts, then a faulty alternator component is indicated. Conduct the "Alternator Component Tests" as detailed in this Chapter.

9. Stop the engine.

With reference to Figure 16.

1. Ensure the key start switch is in the "off" position.
2. The circuit is the same as that used in the previous test except for the millivoltmeter which is now connected between the battery negative terminal and the alternator frame (negative side to frame).

NOTE: Ensure the variable load resistor is in the minimum current draw position (maximum resistance).

3. Start the engine and increase the speed to 2000 rev/min.
