Highwall Mining John Loui Porathur, Pijush Pal Roy, Baotang Shen, Shivakumar Karekal, 2017-07-06 This comprehensive technical book on highwall mining covers theory and practice coupled with practical examples and design aspects. It contains eight extensive chapters elaborating broad spectrum functionalities of highwall mining and its operational aspects covering world scenario economic potential methods of coal extraction design methodology including empirical web pillar design numerical modelling for stress analysis safety factor for web pillars panel and barrier design small and large scale numerical modelling multiple seam interaction and design coal web pillar strength equivalent width concept laboratory testing new web pillar strength formula effect of weak bands in coal seam slope stability safety and ground monitoring hazards and regulatory requirements case examples norms and guidelines for practice. It also summarizes the results of research carried out by the CSIR Central Institute of Mining and Fuel Research CSIR CIMFR India and the Commonwealth Scientific and Industrial Research Organisation CSIRO Australia on the subject. The book will equip readers in understanding the complex multiple seam scenarios for highwall mining and its design for maximum coal recovery from any given site with better economics which will aid the mining companies in extracting locked up coal following the safety norms to avoid hazards and minimise instability issues. A large number of case studies is included to illustrate the application of numerical modelling for prior estimation and viability of highwall mining operations under varying geominig conditions. The book will be of interest to professionals and academics in the field of mining engineering specifically but will also interest civil geomechanical and geological engineers as well as rock mechanics professionals.

Computational Geomechanics and Hydraulic Structures Sheng-Hong Chen, 2018-06-21 This book presents recent research into developing and applying computational tools to estimate the performance and safety of hydraulic structures from the planning and construction stage to the service period. Based on the results of a close collaboration between the author and his colleagues friends students and field engineers it shows how to achieve a good correlation between numerical computation and the actual in situ behavior of hydraulic structures. The book's heuristic and visualized style disseminates the philosophy and road map as well as the findings of the research. The chapters reflect the various aspects of the three typical and practical methods: the finite element method the block element method the composite element method that the author has been working on and made essential contributions to since the 1980s. This book is an advanced continuation of Hydraulic Structures by the same author published by Springer in 2015.

describes the theory and current practices for design of earth lateral support for deep excavations in soil It addresses basic principles of soil mechanics and explains how these principles are embodied in design methods including hand calculations It then introduces the use of numerical methods including the fundamental beam on springs models and then more sophisticated computer programmes which can model soil as a continuum in two or three dimensions Constitutive relationships are introduced that are in use for representing the behaviour of soil including a strain hardening model and a Cam Clay model including groundwater flow and coupled consolidation These methods are illustrated by reference to

practical applications and case histories from the author's direct experience and some of the pitfalls that can occur are discussed. Theory and design are strongly tied to construction practice with emphasis on monitoring the retaining structures and movement of surrounding ground and structures in the context of safety and the Observational Method. Examples are presented for conventional Bottom up and Top down sequences along with hybrid sequences giving tips on how to optimise the design and effect economies of cost and time for construction. It is written for practising geotechnical civil and structural engineers and especially for senior and MSc students.
