Impedance spectroscopy for characterization of biological matter

Juan Jose Montero Rodriguez, 2018 Standard characterization methods of biological cells are time consuming and may reduce cell viability by staining them with markers An alternative fast and non destructive method is developed using impedance spectroscopy which has potential applications in biology The technique is used to identify tumor cells in mice detect bacterial eye infections monitor fruit ripening and measure sweat lactate concentration in humans by using a skin sensor These applications often require a portable measurement system Therefore three portable systems were designed and tested It has been shown that the method can be further improved by four terminal measurements For extension of the method in the millimeter wave frequencies full electromagnetic simulation of the chip has been carried out and electrodes and interconnections have been adjusted accordingly

Motorbooks International, Larry Warren, 1992-05 **The Evolution of Travel Time Information Systems** Margarita Martínez-Díaz, 2022-01-21 This book deals with the estimation of travel time in a very comprehensive and exhaustive way. Travel time information is and will continue to be one key indicator of the quality of service of a road network and a highly valued knowledge for drivers. Moreover, travel times are key inputs for comprehensive traffic management systems. All the above mentioned aspects are covered in this book. The first chapters expound on the different types of travel time information that traffic management centers work with, their estimation, their utility, and their dissemination. They also remark those aspects in which this information should be improved, especially considering future cooperative driving environments. Next, the book introduces and validates two new methodologies designed to improve current travel time information systems which additionally have a high degree of applicability since they use data from widely disseminated sources; they could be immediately implemented by many administrations without the need for large investments. Finally, travel times are addressed in the context of dynamic traffic management systems. The evolution of these systems in parallel with technological and communication advancements is thoroughly discussed. Special attention is paid to data analytics and models including data driven approaches aimed at understanding and predicting travel patterns in urban scenarios. Additionally, the role of dynamic origin to destination matrices in these schemes is analyzed in detail.

Fuzzy Sets in Decision Analysis, Operations Research and Statistics Roman Slowiński, 2012-12-06 Fuzzy Sets in Decision Analysis, Operations Research and Statistics includes chapters on fuzzy preference modeling, multiple criteria analysis, ranking and sorting methods, group decision making, and fuzzy game theory. It also presents optimization techniques such as fuzzy linear and non linear programming applications to graph problems and fuzzy combinatorial methods such as fuzzy dynamic programming. In addition, the book also accounts for advances in fuzzy data analysis, fuzzy statistics, and applications to reliability analysis. These topics are covered within four parts: Decision Making, Mathematical Programming, Statistics and Data Analysis, and Reliability Maintenance and Replacement. The scope and content of the book has resulted from multiple interactions between the editor of the volume, the series editors, the series advisory board, and experts in each chapter area. Each chapter was written by a well known researcher on the topic and reviewed by other experts in the area. These expert reviewers sometimes became co authors because of the extent of their contribution to the chapter. As a result, twenty five authors from twelve countries and four continents were involved in the creation of the 13 chapters, which enhances the international character of the project and gives an idea of how carefully the Handbook has been developed.
