Protocols for Micropropagation of Woody Trees and Fruits S.Mohan Jain,H.

Häggman,2007-09-18 Micropropagation has become a reliable and routine approach for large scale rapid plant multiplication which is based on plant cell tissue and organ culture on well defined tissue culture media under aseptic conditions A lot of research efforts are being made to develop and refine micropropagation methods and culture media for large scale plant multiplication of several number of plant species However many forest and fruit tree species still remain recalcitrant to in vitro culture and require highly specific culture conditions for plant growth and development The recent challenges on plant cell cycle regulation and the presented potential molecular mechanisms of recalcitrance are providing excellent background for understanding on totipotency and what is more development of micropropagation protocols For large scale in vitro plant production the important attributes are the quality cost effectiveness maintenance of genetic fidelity and long term storage The need for appropriate in vitro plant regeneration methods for woody plants including both forest and fruit trees is still overwhelming in order to overcome problems facing micropropagation such as somaclonal variation recalcitrant rooting hyperhydricity polyphenols loss of material during hardening and quality of plant material Moreover micropropagation may be utilized in basic research in production of virus free planting material cryopreservation of endangered and elite woody species applications in tree breeding and reforestation

Cytochrome P450 Protocols Ian R. Phillips,Elizabeth A.

Shephard,2008-02-02 In Cytochrome P450 Protocols Ian Phillips and Elizabeth Shephard assemble a comprehensive collection of cutting edge techniques for the investigation of cytochromes P450 Described in detail by hands on experimentalists for easy reproducibility these methods include spectral analysis purification and enzymatic assays expression in heterologous systems and the production and use of antibodies as well as methods for quantification of gene expression transfection of hepatocytes and for the investigation of DNA protein interactions and genetic polymorphisms In addition because of the growing importance of in vitro systems in pharmacological toxicology the book contains techniques for the culture of rodent and human hepatocytes and human epidermis Cytochrome P450 induction as a biomarker for

environmental pollution and the generation of mice with targeted gene disruptions complete this exhaustive collection of core techniques Cytochrome P450 Protocols includes in one volume both state of the art and classic methods that have not been superseded but remain extremely useful The collection provides both novice and experienced researchers across many fields toxicology pharmacology environmental biology biochemistry and molecular biology all the tools needed to elucidate the crucial biological role played by cytochromes P450 in the metabolism of therapeutic drugs chemical carcinogens and environmental pollutants Network Protocols Brian Randell,1986 **Cytoskeleton Methods and Protocols** Ray H. Gavin,2008-02-03 Over the past two decades experimental studies have solidified the interpretation of the cytoskeleton as a highly dynamic network of microtubules actin microfilaments intermediate filaments and myosin filaments Rather than a network of disparate fibers these polymers are often interconnected and display synergy which is the combined action of two or more cytoskeletal polymers to achieve a specific cellular structure or function Cross communication among cytoskeletal polymers is thought to be achieved through cytoskeletal polymer accessory proteins and molecular motors that bind two or more cytoskeletal polymers Development of the modern concept of the cytoskeleton is a direct outgrowth of advances in experimental tools and reagents that are available to cell and molecular biologists Technological advances and refinements in cell imaging have made it possible to selectively image a single cytoskeletal polymer and monitor its dynamics through the use of fluorescence probes in vitro and in vivo Two decades ago cytoskeletal research was limited to a few perturbation reagents that included colchicine and cytochalasin Today the perturbation arsenal has expanded to a highly selective group of reagents that includes Taxol nocodazole benomyl latrunculin jasplakinolide and such endogenous proteins as gelsolin These reagents enable the investigator to selectively perturb or destroy a cytoskeletal polymer while leaving other cytoskeletal polymers intact Site specific monoclonal antibodies that target a specific cytoskeletal polymer have proven to be highly selective affinity tools for cytoskeletal research *DNA Sequencing Protocols* Annette M. Griffin,Hugh G. Griffin,2008-02-02 The purpose of DNA Sequencing Protocols is to provide detailed practical procedures for the widest range of DNA sequencing methods and we believe that all the vanguard techniques now being applied in this fast evolving field are comprehensively covered Sequencing technology has advanced at a phenomenal rate since the original methods were first described in the late 1970s and there is now a huge variety of strategies and methods that can be employed to determine the sequence of any DNA of interest More recently a large number of new and innovative sequencing techniques have been developed including the use of such novel polymerases as Tag polymerase and Sequenase the harnessing of PCR technology for linear amplification cycle sequencing and the advent of automated DNA sequencers DNA sequencing is surely one of the most important techniques in the molecular biology laboratory Sequence analysis is providing an increasingly useful approach to the characterization of biological systems and major multinational projects are already underway to map and sequence the entire genome of organisms such as Escherichia coli Saccharomyces cerevisiae Caenorhabditis elegans and

Homo sapiens Most scientists recognize the importance of DNA sequence data and perceive DNA sequencing as a valuable and indispensable aspect of their work Recent technological advances especially in the area of automated sequencing have removed much of the drudgery that was formerly associated with the technique whereas innovative computer software has greatly simplified the analysis and manipulation of sequence data *Step Wise Protocols for Somatic Embryogenesis of Important Woody Plants* Shri Mohan Jain, Pramod Gupta, 2018-05-30 World population is increasing at an alarming rate and this has resulted in increasing tremendously the demand for tree products such as wood for construction materials fuel and paper fruits oils and medicines etc This has put immense pressure on the world's supplies of trees and raw material to industry and will continue to do so as long as human population continues to grow Also the quality of human diet especially nutritional components is adversely affected due to limited genetic improvement of most of fruit trees Thus there is an immediate need to increase productivity of trees Improvement has been made through conventional breeding methods however conventional breeding is very slow due to long life cycle of trees A basic strategy in tree improvement is to capture genetic gain through clonal propagation Clonal propagation via organogenesis is being used for the production of selected elite individual trees However the methods are labour intensive costly and produce low volumes Genetic gain can now be captured through somatic embryogenesis Formation of embryos from somatic cells by a process resembling zygotic embryogenesis is one of the most important features of plants In 1958 Reinert in Germany and Steward in USA independently reported somatic embryogenesis in carrot cultures Since then tremendous progress in somatic embryogenesis of woody and non woody plants has taken place It offers a potentially large scale propagation system for superior clones
