**in Plants and Crops** Jose R. Peralta-Videa, Sina Fallah, Meijian Yang, 2025-06-02 Oxygenic photosynthesis in plants initiates when the pigments such as chlorophyll and carotenoids harvest light and transfer the energy toward reaction centers where it is converted to chemical energy via photochemical charge separation Most importantly plants effectively use the light

energy and convert carbon dioxide and water into carbohydrates and oxygen sustaining the lives on Earth Although light energy is vital for photosynthesis process excessive light intensity can cause photoinhibition in plants reducing photochemical efficiency and also can cause photooxidative system damage On the other hand low light intensity could also negatively affect photosynthesis which therefore can severely restrict plant growth and development Under such circumstances of different light intensities plants also have various adaptive strategies to reduce the potential damages caused by light stress Therefore this Research Topic welcomes collections on the evolving and adapting strategies in plants in order to efficiently utilize light energy under light stresses and sustain plant growth      Subcellular Compartmentalization of Plant Antioxidants and ROS Generating Systems Francisco J.
