18.17.1

To power a hydroelectric system, two reservoirs having elevations that produce a constant pressure gradient. The water flows through a turbine, which converts the pressure gradient into mechanical work. The turbine is connected to a generator, which converts the mechanical work into electrical energy. The generator is connected to a load, which converts the electrical energy into heat. The heat is then transferred to a reservoir, which is at a higher elevation than the first reservoir. The heat transfer is represented by the equation:

$$Q = \frac{P}{\eta} \left(\frac{1}{T_1} - \frac{1}{T_2} \right)$$

where Q is the heat transfer, P is the power, η is the efficiency, T_1 is the temperature of the first reservoir, and T_2 is the temperature of the second reservoir.
