

Membrane Function

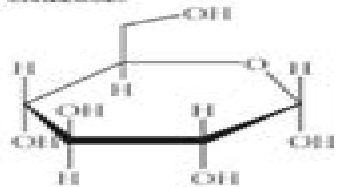

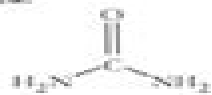

How does the cell membrane control movement of materials?

Directions: Remember to answer the following questions using a **different color font**.

Why?

The membrane is critical to the maintenance of homeostasis in living organisms. The cell membrane separates the cell from the external environment and plays a critical role in regulating movement of material in and out of the cell. Additionally, eukaryotic cells are made complex by the presence of internal membranes that form organelles, so the cells may become specialized. These organelle membranes create compartments within the cell that can do specific functions.

small	large		

1. Consider the ions and molecules in Model 1.

a. Identify at least two substances that would need to move into a cell to maintain homeostasis.

Water and oxygen

b. Briefly explain why the cell needs each of the substances you identified in part a.

It helps organisms grow and turn food into energy

2. Consider the ions and molecules in Model 1.

a. Identify at least two substances that would need to move out of a cell to maintain homeostasis.

Carbon dioxide and urea

b. Briefly explain the source of the molecules you identified in part a.

It helps cells stimulate energy and break down oxygen for plant cells

3. Complete the table by labeling the types of substances as polar or nonpolar and large or small.

Membrane Structure and Function W. Howard Evans, John M. Graham, 1989 This study introduces the reader to the basic components of membranes and describes their functions in for example regulation of the cell's environment and the transport of nutrients and waste

Membrane Structure and Function, 1987 *The Plant Plasma Membrane* Christer Larsson, Ian M. Moller, 2012-12-06 The plasma membrane forms the living barrier between the cell and its surroundings For this reason it has a wide range of important functions related to the regulation of the composition of the cell interior and to communication with the cell exterior The plasma membrane has therefore attracted a lot of research interest Until the early 1970's it was only possible to study the plasma membrane in situ its structure e.g. by electron microscopy and its function e.g. by uptake of radioactively labeled compounds into the intact cell or tissue The first isolation of plant protoplasts by enzymatic digestion of the cell wall in the early 1970's was an important step forward in that it provided direct access to the outer surface of the plasma membrane More importantly T K Hodges and R J Leonard in 1972 published the description of a method by which a fraction enriched in plasma membranes could be isolated from plant tissues using sucrose gradient centrifugation As a result the 1970's saw a leap forward in our understanding of the structure and function of the plasma membrane In 1981 S Widell and C Larsson published the first of a series of papers in which plasma membrane vesicles of high yield and purity were isolated from a wide range of plant tissues using aqueous polymer two phase partitioning

Structure and Dynamics of Membranes R. Lipowsky, E. Sackmann, 1995-06-15 The first volume of the Handbook deals with the amazing world of biomembranes and lipid bilayers Part A describes all aspects related to the morphology of these membranes beginning with the complex architecture of biomembranes continues with a description of the bizarre morphology of lipid bilayers and concludes with technological applications of these membranes The first two chapters deal with biomembranes providing an introduction to the membranes of eucaryotes and a description of the

evolution of membranes The following chapters are concerned with different aspects of lipids including the physical properties of model membranes composed of lipid protein mixtures lateral phase separation of lipids and proteins and measurement of lipid protein bilayer diffusion Other chapters deal with the flexibility of fluid bilayers the closure of bilayers into vesicles which attain a large variety of different shapes and applications of lipid vesicles and liposomes Part B covers membrane adhesion membrane fusion and the interaction of biomembranes with polymer networks such as the cytoskeleton The first two chapters of this part discuss the generic interactions of membranes from the conceptual point of view The following two chapters summarize the experimental work on two different bilayer systems The next chapter deals with the process of contact formation focal bounding and macroscopic contacts between cells The cytoskeleton within eucaryotic cells consists of a network of relatively stiff filaments of which three different types of filaments have been identified As explained in the next chapter much has been recently learned about the interaction of these filaments with the cell membrane The final two chapters deal with membrane fusion
