THE PERIODIC TABLE OF THE ELEMENTS

THE PERIODIC TABLE OF THE ELEMENTS

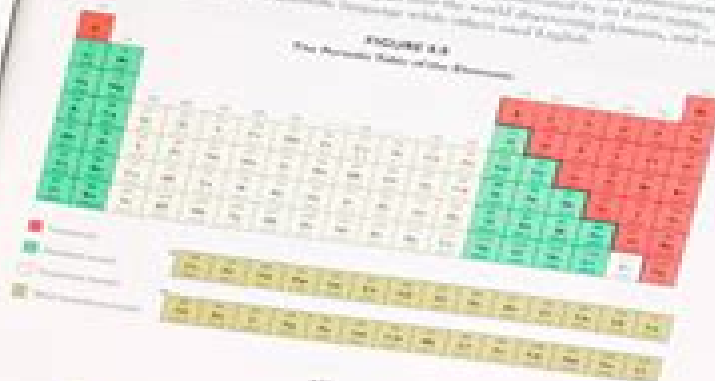

The periodic table of the elements (Figure 2.5) is a tabulation of chemical elements arranged according to their atomic number (Z), which is the number of protons in the nucleus of an atom. The elements are arranged in rows (periods) and columns (groups). The periodic table is a fundamental tool in chemistry, used to predict the properties of elements and to understand the trends in chemical behavior.

The periodic table is divided into four main blocks: s-block, p-block, d-block, and f-block. The s-block contains the alkali metals and alkaline earth metals. The p-block contains the nonmetals and metalloids. The d-block contains the transition metals. The f-block contains the lanthanides and actinides.

The periodic table is a visual representation of the periodic law, which states that the properties of the elements are a periodic function of their atomic number. The periodic table is a fundamental tool in chemistry, used to predict the properties of elements and to understand the trends in chemical behavior.
