Dynamics And Mission Design Near Libration Points -

Vol II: Fundamentals: The Case Of Triangular Libration Points Gerard Gomez, Jaume Llibre, R Martinez, Carles Simo, 2001-02-12 It is well known that the restricted three body problem has triangular equilibrium points. These points are linearly stable for values of the mass parameter below Routh's critical value 1. It is also known that in the spatial case they are nonlinearly stable not for all the initial conditions in a neighborhood of the equilibrium points L4 L5 but for a set of relatively large measures. This follows from the celebrated Kolmogorov Arnold Moser theorem. In fact there are neighborhoods of computable size for which one obtains practical stability in the sense that the massless particle remains close to the equilibrium point for a big time interval, some millions of years for example. According to the literature, what has been done in the problem follows two approaches: a numerical simulations of more or less accurate models of the real solar system; b study of periodic or quasi periodic orbits of some much simpler problem. The concrete questions that are studied in this volume are: a Is there some orbit of the real solar system which looks like the periodic orbits of the second approach? That is, are there orbits performing revolutions around L4 covering eventually a thick strip? Furthermore, it would be good if those orbits turn out to be quasi periodic. However, there is no guarantee that such orbits exist or will be quasi periodic. b If the orbit of a exists and two particles (spacecraft) are put close to it, how do the mutual distance and orientation change with time? As a final conclusion of the work, there is evidence that orbits moving in a somewhat big annulus around L4 and L5 exist, that these orbits have small components out of the plane of the Earth-Moon system and that they are at most mildly unstable.

Dynamics and Mission Design Near Libration Points Gerard Gomez, 2001 This book studies several problems related to the analysis of planned or possible spacecraft missions. It is divided into four chapters. The first chapter is devoted to the computation of quasiperiodic solutions for the motion of a spacecraft near the equilateral points of the Earth-Moon system. The second chapter gives a complete description of the orbits near the collinear point L1 between the Earth and the Sun in the restricted three body problem (RTBP) model. In the third chapter, methods are developed to compute the nominal orbit and to design and test the control strategy for the spacecraft. **Math into LaTeX** George Grätzer, 2013-12-01 AMS packages that replaced AMS-TeX version 1.1 but the book still had an AMS-TeX centric view. This third edition is about LaTeX. Where necessary, I recommend that you use packages to extend LaTeX's capabilities. For typesetting mathematics, I strongly recommend that you use the AMS packages (AMS packages version 2.0). The American Mathematical Society released version 2.0 of the AMS packages in 1999. This third edition covers the changes made in this release. Books The first and second editions of this book dealt primarily with the tasks involved in writing articles. In Part V, the third edition addresses the issues that arise when creating longer documents. In addition to chapters on BIBTEX and MakeIndex, I have added a new chapter on writing books. Appendix F illustrates the importance of choosing a well designed book document class. Other changes LaTeX2 has been remarkably stable since its release in 1996, becoming the standard LaTeX (see Section C.1.2). Changes have been minor except for advances in using LaTeX with non-English languages (see the new Appendix E) and the

widespread use of the PostScript CM and AMS fonts see the new Section D I Reorganization and additions Due to the new emphasis on writing books a number of sections and subsections have moved from Chapter 2 and Chapters 6 8 to the new Chapter 12

Dynamics and Mission Design Near Libration Points: Advanced methods for collinear points Gerard Gómez,2001 This book studies several problems related to the analysis of planned or possible spacecraft missions It is divided into four chapters The first chapter is devoted to the computation of quasiperiodic solutions for the motion of a spacecraft near the equilateral points of the Earth Moon system The second chapter gives a complete description of the orbits near the collinear point 1 between the Earth and the Sun in the restricted three body problem RTBP model In the third chapter methods are developed to compute the nominal orbit and to design and test the control strategy for the quasiperiodic halo orbits In the last chapter the transfer from the Earth to a halo orbit is studied
