Hadron models and related New Energy issues Florentin Smarandache, V. Christianto, 2007-01-01 The present book covers a wide range of issues from alternative hadron models to their likely implications to New Energy research including alternative interpretation of low energy reaction coldfusion phenomena The authors explored some new approaches to describe novel phenomena in particle physics M Pitkanen introduces his nuclear string hypothesis derived from his Topological Geometro-dynamics theory while E Goldfain discusses a number of nonlinear dynamics methods including bifurcation pattern formation complex Ginzburg Landau equation to describe elementary particle masses Fu Yuhua discusses a plausible method for prediction of phenomena related to New Energy development F Smarandache discusses his unmatter hypothesis and A Yefremov et al discuss Yang Mills field from Quaternion Space Geometry Diego Rapoport discusses link between Torsion fields and Hadronic Mechanic A H Phillips discusses semiconductor nanodevices while V and A Boju discuss Digital Discrete and Combinatorial methods and their likely implications to New Energy research Pavel Pintr et al describe planetary orbit distance from modified Schrodinger equation and M Pereira discusses his new Hypergeometrical description of Standard Model of elementary particles The present volume will be suitable for researchers interested in New Energy issues in particular their link with alternative hadron models and interpretation While some of these discussions may be found a bit too theoretical our view is that once these phenomena can be put into rigorous theoretical framework thereafter more open minded physicists may be more ready to consider these New Energy methods more seriously Our basic proposition in the present book is that considering these new theoretical insights one can expect there are new methods to generate New Energy technologies which are clearly within reach of human knowledge in the coming years

Femtochemistry and Femtobiology Monique M. Martin, James T. Hynes, 2004-04-16 This book reflects the heights of knowledge of ultrafast chemical processes attained in these early years of the 21st century the latest research in femtosecond and picosecond molecular processes in Chemistry and Biology carried out around the world is described here in more than 110 articles The results were presented and discussed at the VIth International Conference on Femtochemistry in Paris France from July 6 to July 10 2003 The articles published here were reviewed by referees selected from specialists in

the Femtochemistry community guaranteeing a collective responsibility for the quality of the research reported in the next 564 pages Femtochemistry is an ever growing field where new research areas are constantly opening up and one which both stimulates and accompanies the development of ultrafast technologies The increasing interest in femtobiology and chemistry at the frontier with biology is an obvious indicator of the present impact of life sciences in our society New materials and reactions at surfaces are also some of the relatively new topics that promise rapid developments New methodologies and technologies for probing and following in real time molecular dynamical phenomena have appeared within the last ten years or so These methods based on multidimensional IR spectroscopies ultrafast X ray and electron diffraction techniques are well represented in this book Of ever improving performance they are now applied to the characterization of structural dynamics of an increasing number of chemical and biological systems This book reports the state of research in Femtochemistry and Femtobiology presented at Paris at the Maison de la Chimie in July 2003 representing the tenth anniversary of the conference Overview of the most recent research on ultrafast events Application of new methodologies on chemical and biological systems Contributions by key players in the field Handbook of Radioactivity Analysis Michael F.
