Advanced Solutions in Diagnostics and Fault Tolerant Control Jan M. Kościelny, Michał Syfert, Anna Sztyber, 2017-07-28 This book highlights the latest achievements concerning the theory methods and practice of fault diagnostics fault tolerant systems and cyber safety When considering the diagnostics of industrial processes and systems increasingly important safety issues cannot be ignored In this context diagnostics plays a crucial role as a primary measure of the improvement of the overall system safety integrity level Obtaining the desired diagnostic coverage or providing an appropriate level of inviolability of the integrity of a system is now practically inconceivable without the use of fault detection and isolation methods Given the breadth and depth of its coverage the book will be of interest to researchers faced with the challenge of designing technical and medical diagnosis systems as well as junior researchers and students in the fields of automatic control robotics computer science and artificial intelligence

Sliding Mode Control Using Novel Sliding Surfaces B. Bandyopadhyay, Fulwani Deepak, Kyung-Soo Kim, 2009-10-14 After a survey paper by Utkin in the late 1970s sliding mode control methodologies emerged as an effective tool to tackle uncertainty and disturbances which are inevitable in most of the practical systems Sliding mode control is a particular class of variable structure control which was introduced by Emel'yanov and his colleagues The design paradigms of sliding mode control has now become a mature design technique for the design of robust controller of uncertain system In sliding mode technique the state trajectory of the system is constrained on a chosen manifold or within some neighborhood thereof by an appropriate control action This manifold is also called a switching surface or a sliding surface During sliding mode system dynamics is governed by the chosen manifold which results in a well celebrated invariance property towards certain classes of disturbance and model mismatches The purpose of this monograph is to give a different dimension to sliding surface design to achieve high performance of the system Design of the switching surface is vital because the closed loop dynamics is governed by the parameters of the sliding surface Therefore sliding surface should be designed to meet the closed loop specifications Many systems demand high performance with robustness To address this issue of achieving high performance with robustness we propose nonlinear surfaces for different classes of systems The nonlinear surface is designed such that it changes the system's closed loop damping ratio from its initial low value to a final high value

Analysis and Synthesis of Dynamic Systems with Positive Characteristics Jun Shen, 2017-03-27 This thesis develops several systematic and unified approaches for analyzing dynamic systems with positive characteristics or a more general cone invariance property Based on these analysis results it uses linear programming tools to address static output feedback synthesis problems with a focus on optimal gain performances Owing to their low computational complexity the established controller design algorithms are applicable for large scale systems The theory and control strategies developed will not only be useful in handling large scale positive delay systems with improved solvability and at lower cost but also further our understanding of the system characteristics in other related areas such as distributed coordination of networked multi agent systems formation control of multiple robots

Large Space Structures: Dynamics and Control S.N. Atluri, A.K. Amos, 2012-12-06 This monograph is intended to provide a snapshot of the status and opportunities for advancement in the technologies of dynamics and control of large flexible spacecraft structures It is a reflection of the serious dialog and assessments going on all over the world across a wide variety of scientific and technical disciplines as we contemplate the next major milestone in mankind's romance with

space the transition from exploration and experimentation to commercial and defense exploitation This exploitation is already in full swing in the space communications area Both military and civilian objectives are being pursued with increasingly more sophisticated systems such as large antenna reflectors with active shape control Both the NATO and Warsaw pact alliances are pursuing permanent space stations in orbit large structural systems whose development calls for in situ fabrication and or assembly and whose operation will demand innovations in controls technology The last ten years have witnessed a fairly brisk research activity in the dynamics and control of large space structures in order to establish a technology base for the development of advanced spacecraft systems envisioned for the future They have spanned a wide spectrum of activity from fundamental methods development to systems concept studies and laboratory experimentation and demonstrations Some flight experiments have also been conducted for various purposes such as the characterization of the space environment durability of materials and devices in that environment assembly and repair operations and the dynamic behavior of flexible structures It is this last area that has prompted this monogram

Modelling Dynamics in Processes and Systems Wojciech Mitkowski, 2009-06-01 Dynamics is what characterizes virtually all phenomena we face in the real world and processes that proceed in practically all kinds of inanimate and animate systems notably social systems For our purposes dynamics is viewed as time evolution of some characteristic features of the phenomena or processes under consideration It is obvious that in virtually all non trivial problems dynamics can not be neglected and should be taken into account in the analyses to first get insight into the problem consider and second to be able to obtain meaningful results A convenient tool to deal with dynamics and its related evolution over time is to use the concept of a dynamic system which for the purposes of this volume can be characterized by the input control state and output spaces and a state transition equation Then starting from an initial state we can find a sequence of consecutive states outputs under consecutive inputs controls That is we obtain a trajectory The state transition equation may be given in various forms exemplified by differential and difference equations linear or nonlinear deterministic or stochastic or even fuzzy imprecisely specified fully or partially known etc These features can give rise to various problems the analysts may encounter like numerical difficulties instability strange forms of behavior e g chaotic etc This volume is concerned with some modern tools and techniques which can be useful for the modeling of dynamics We focus our attention on two important areas which play a

key role nowadays namely automation and robotics and biological systems We also add some new applications which can greatly benefit from the availability of effective and efficient tools for modeling dynamics exemplified by some applications in security systems **Dimension Reduction of Large-Scale Systems** Peter Benner,Volker Mehrmann,Danny C.
