

8. Peripheral data registers: TL0, TH0, TL1, TH1, and SBUF.
Peripheral control registers: IP, IE, TMOD, TCON, SCON, and PCON.
9. When we switch the bank, complete new set of memory locations with names R0 to R7 are made available for use by instructions. So without saving the contents of current bank's R0 to R7 we can directly use new set of R0 to R7. This will save time to preserve the registers contents when we call a subroutine i.e. save context switching time.
10. The stack is a section of memory locations in the internal RAM that is used for temporary storage and retrieval of data (or addresses) while the execution of a program. It is the last in first out (LIFO) type memory. This section of memory is accessed by certain instructions or events (like interrupts).
