Biomechanical Performance and Relevant Mechanism of Physical Medicine and Rehabilitation for Neuromusculoskeletal Disorders Qipeng Song,Li Li,Pui Wah Kong,Lin

Wang,Feng Wei,2023-11-23 Biomechanical performance is a key to evaluating effectiveness in physical medicine and rehabilitation for neuromusculoskeletal disorders Assessments can be applied to degenerative dysfunction e g falls or knee osteoarthritis in older adults and sports related injuries e g ankle sprain or anterior cruciate ligament injury Patients body movements and daily activity functions can be compared to the state of pre injury condition or to the level of healthy individuals Some cutting edge studies have gone a step further and used biomechanical performance to develop physical medicine and rehabilitation approaches and explore the mechanisms behind their effectiveness However such studies are still relatively rare This research topic is intended to encourage more relevant projects to be published This research topic aims to encourage researchers to use biomechanical performance to design advanced physical medicine and rehabilitation approaches evaluate the effectiveness of the rehabilitation approaches and explore the mechanisms by which rehabilitation approaches work for neuromusculoskeletal disorders Some studies have developed stretching approaches for the rehabilitation of knee osteoarthritis in older adults by measuring biomechanical performance during functional activities Some studies indicated that the mechanism of physical activity to reduce falls in older adults lies in its effectiveness in increasing proprioceptive sensitivity and further indicated that rehabilitation of proprioception may be a key to reducing falls in the fall prone older adult population Some other studies analyzed biomechanical performance in ankle ligament injuries to understand when how and why ligaments fail As a result this research topic will expand the application of biomechanical performance to better understand and treat neuromusculoskeletal disorders

Transitions Between Consciousness and Unconsciousness Marcus Rothkirch,Morten Overgaard,Guido Hesselmann,2018-03-13 Over the last years a large body of experimental data have been

generated in the attempt to understand consciousness and its neural underpinnings. In this respect particular interest has been paid to the attempt to distinguish between conscious experience and unconscious states which however may still be considered as mental states e.g. in virtue of their representational nature. This is of course not without reason. A deep understanding of that which specifically characterizes conscious states including neural correlates and cognitive functions may crucially inform the ambition of understanding the relation between experience and the physical world. Nevertheless the question has historically been challenged by the fact that consciousness is available in the first person only not to other people including scientists. Different methodological traditions and choices have led to quite different understandings of how conscious and unconscious states relate and diverse empirical work has been inspired and guided by various cognitive and neurobiological theories of consciousness. The very diverse viewpoints include such different positions as the idea that unconscious states are associated with the very same functional characteristics as conscious states and the idea that no informational state that is available for action can be completely unconscious. The Research Topic Transitions between consciousness and unconsciousness is therefore devoted to this particular question how to understand the relation and transition between consciousness and unconsciousness. We hope that the reader will find the collected articles both informative and thought provoking and that this Research Topic will stimulate the scientific debate.
