The three controllers achieve closed-loop H_2 norms of 0.04, 0.07 and 0.03, respectively. Computed closed-loop modes and compare the gains from road disturbance to y_1, y_2, y_3 for the passive and active systems. It is clear that all three controllers reduce suspension deflection and body acceleration below the set points.

So far you have designed $\hat{K}_\infty$ controllers that meet the performance objectives for the nominal closed-loop system. This model is only an approximation of the true system and you need to make sure performance is maintained in the face of model errors and uncertainties. This is called robust performance. Next you will synthesize design μ -controllers that achieve robust performance for the entire family of μ -nominal systems by synthesized with the design function using the structured singular value μ , μ_{robust} of "worst-case" performance ($\mu = 0.1$).
