Principles of Physical Chemistry Hans Kuhn, David H. Waldeck, Horst-Dieter Försterling, 2024-10-25 Core textbook showcasing the broad scope and coherence of physical chemistry. Principles of Physical Chemistry introduces undergraduate students to the concepts and methods of physical chemistry which are fundamental to all of Chemistry. In their unique approach the authors guide students along a logically consistent pathway from the principles of quantum mechanics and molecular structure to the properties of ensembles and supramolecular machines with many examples from biology and nanoscience. By systematically proceeding from atoms to increasingly complex forms of matter the book elucidates the connection between recognizable paradigms and modern chemistry research in a student friendly manner. To promote intuition and understanding for beginning students the text introduces concepts before proceeding to more rigorous treatments. Rigorous proofs and derivations are provided as electronic supplements for more advanced students. The book poses over 900 exercises and problems to help the student learn and master methods for physicochemical reasoning. Computational supplementary material including Fortran simulations, MathCAD exercises and Mathematica programs are included on a companion website. Some topics discussed in the text are Electronic structure and Variational Principle including Pauli exclusion, spin orbit interactions and electron confinement in quantum dots. Chemical bonding and molecular structure including electron tunneling, comparison of electron in a box models and electron orbital methods and the mechanics of chemical bonds. Absorption and emission of light including transition dipoles for electron systems, coupled chromophores, excitons and chiroptical activity. Statistical description of molecular ensembles including microscopic interpretations of phase transitions, entropy, work and heat. Chemical equilibria including statistical description of equilibrium constants, electrochemistry and the exposition of fundamental reaction types. Reaction kinetics and reaction dynamics including nonlinear coupled reactions, femtochemistry and solvent effects on reactions. Physicochemical properties of macromolecules and the principles of supramolecular assemblies including polymer dynamics and chemical control of interfaces. The logic of supramolecular machines and their manipulation of photon, electron and nuclear motion. With its highly coherent and systematic approach to the subject Principles of Physical Chemistry is an ideal textbook and resource for students in undergraduate physical chemistry courses especially those in programs of study related to chemistry engineering and molecular and chemical biology.
