Archispeak Tom Porter, 2004-08-02 Widely used in architectural circles in the heat of discussion the recurrent use of particular words and terms has evolved into a language of design jargon Commonly found in architectural literature and journalism in critical design debate and especially in student project reviews Archispeak can seem insular and perplexing to others and particularly to the new architectural student often incomprehensible There is a need to translate architectural design concepts into spoken and written commentary each word in use embodying a precise and universally accepted architectural meaning If we explore the vocabulary of this language we gain insight into good design practice and into collective understanding of what constitutes a refined architecture This unique illustrated guide will help students understand the nuances of this specialized language and help them in communicating their own design ideas

Modeling Life Alan Garfinkel, Jane Shevtsov, Yina Guo, 2017-09-06 This book develops the mathematical tools essential for students in the life sciences to describe interacting systems and predict their behavior From predator prey populations in an ecosystem to hormone regulation within the body the natural world abounds in dynamical systems that affect us profoundly Complex feedback relations and counter intuitive responses are common in nature this book develops the quantitative skills needed to explore these interactions Differential equations are the natural mathematical tool for quantifying change and are the driving force throughout this book The use of Euler's method makes nonlinear examples tractable and accessible to a broad spectrum of early stage undergraduates thus providing a practical alternative to the procedural approach of a traditional Calculus curriculum Tools are developed within numerous relevant examples with an emphasis on the construction evaluation and interpretation of mathematical models throughout Encountering these concepts in context

students learn not only quantitative techniques but how to bridge between biological and mathematical ways of thinking Examples range broadly exploring the dynamics of neurons and the immune system through to population dynamics and the Google PageRank algorithm Each scenario relies only on an interest in the natural world no biological expertise is assumed of student or instructor Building on a single prerequisite of Precalculus the book suits a two quarter sequence for first or second year undergraduates and meets the mathematical requirements of medical school entry The later material provides opportunities for more advanced students in both mathematics and life sciences to revisit theoretical knowledge in a rich real world framework In all cases the focus is clear how does the math help us understand the science
