DNA was identified as the genetic material relatively recently, unlike proteins. The initial studies were conducted by two teams that added up to this discovery: 1) Oswald Avery's research, in which he experimentally used 1) *Streptococcus pneumoniae* bacteria, 2) bacteria that caused disease (bacteria that were disease-causing), and 3) DNA, as the genetic material.

Griffith finds a "transforming principle."

In 1928, a British microbiologist named Frederick Griffith discovered that bacteria of the *Streptococcus pneumoniae* species could "transform" from non-virulent to virulent. He discovered that non-virulent bacteria, when taken up by the bacteria, gained the ability to become virulent.

Griffith used bacteria that were of the virulent strain, which he called "S" for "smooth," and the non-virulent strain, which he called "R" for "rough." He discovered that the non-virulent bacteria, when taken up by the bacteria, gained the ability to become virulent.

Griffith concluded that some "transforming principle" was being transferred from the virulent bacteria to the non-virulent bacteria. He called this "transforming principle." He called this "transforming principle."

Read the passage "Griffith's Experiment" and answer the questions that follow.

Griffith's Experiment

Griffith's experiment was designed to identify the transforming principle.

Griffith's Experiment: Transforming Principle

Guide to Biometrics Ruud M. Bolle,Jonathan H. Connell,Sharath Pankanti,Nalini K. Ratha,Andrew W. Senior,2013-06-29 Starting with fingerprints more than a hundred years ago there has been ongoing research in biometrics Within the last forty years face and speaker recognition have emerged as research topics However as recently as a decade ago biometrics itself did not exist as an independent field Each of the biometric related topics grew out of different disciplines For example the study of fingerprints came from forensics and pattern recognition speaker recognition evolved from signal processing the beginnings of face recognition were in computer vision and privacy concerns arose from the public policy arena One of the challenges of any new field is to state what the core ideas are that define the field in order to provide a research agenda for the field and identify key research problems Biometrics has been grappling with this challenge since the late 1990s With the maturation of biometrics the separate biometrics areas are coalescing into the new discipline of biometrics The establishment of biometrics as a recognized field of inquiry allows the research community to identify problems that are common to biometrics in general It is this identification of common problems that will define biometrics as a field and allow for broad advancement Manual on the development and use of FAO and WHO specifications for microbial pesticides World Health Organization,Food and Agriculture Organization of the United Nations,2024-04-26 **Mandated Benefits 2024 Compliance Guide** Wagner,2023 **Artificial Intelligence-Based System Models in Healthcare** A.
