BLS for Healthcare Providers Critical Concepts

High-quality CPR improves a victim's chances of survival. The critical characteristics of high-quality CPR include:

- **Start compressions within 10 seconds** of recognition of cardiac arrest. It is important to compress to the appropriate depth to create blood flow. Compressions are important because they pump blood to the rest of the body.
- **Push hard, push fast:** Compress at a rate of at least 100/min with a depth of at least 2 inches (5cm) for adults, approximately 2 inches (5cm) for children, and approximately 1½ or 1.5 inches (4cm) for infants.
- **Allow complete chest recoil** after each compression. Complete chest recoil contributes to effective CPR by allowing the heart to refill with blood between compressions.
- **Minimize interruptions** in compressions (try to limit interruptions to < 10 seconds).
- **Give effective breaths** that make the chest rise.
- **Avoid excessive ventilation.**

Automated External Defibrillator-AED

- As soon as an AED becomes available, the first step the rescuer should perform is to turn on the AED.
- After the AED delivers a shock, the rescuer should immediately restart CPR, beginning with chest compressions.
- Using an AED for a child less than 8 years of age, adult pads/dose may be used if pediatric pads/dose attenuator are not available.
