# Shooting Stars

Have you ever seen a shooting star? Shooting stars happen anytime, however they are best seen at night. They can travel as fast as 120,000 miles per hour! If you have seen one, you've actually seen a meteor fall through space toward Earth. Meteors start out as frozen chunks of dust, rocks, and gas that move through our solar system. They can be as small as a grain of sand or as large as a boulder.

They orbit around the sun like the planets. When the sun heats the chunks, small pieces break off. The pieces can fall toward Earth and catch on fire. They become meteors. The temperature of a meteor is about 3,000 degrees Fahrenheit. When people see a shooting star in the sky, it is actually a trail of light behind a burning meteor. These light trails can be several kilometers long.

The color of the light trailing behind the meteor depends on the minerals that it is made of. Different elements burn different colors. If there are a lot of meteors falling at once, it is called a meteor shower. Some scientists even study meteors to help them make predictions about the weather. Most meteors burn up completely before they even reach the earth.
