

Name:

The Cell Cycle: What controls the life and development of a cell?

(modified from POGIL)

1. How many phases are in the cell cycle as shown in the diagram in Model 1? 4 phases.

2. Starting at the starred (*) cell, what is the order of the stages of a cell's life?

G₁, S, G₂, M

3. During which phase does the size of the cell increase?
During G₁

4. During which phase does the number of cells increase?
Mitosis

5. Considering your answer to Questions 3 and 4, identify two ways that the growth of an organism can be accomplished through the events of the cell cycle.

An organism can grow when it is damaged, and when it goes through the cell cycle

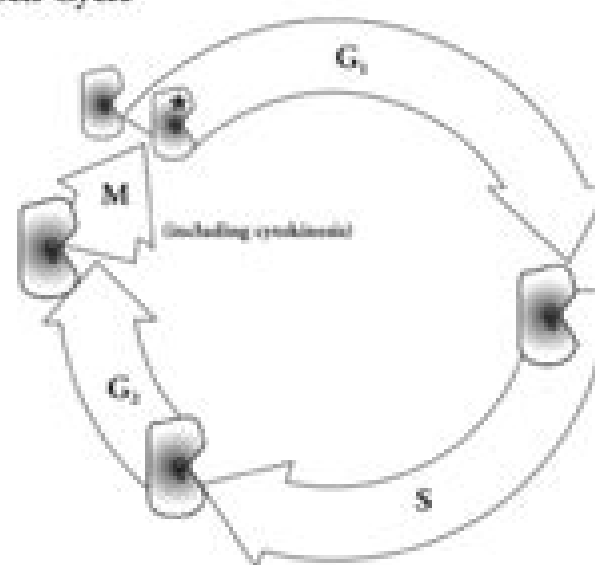

6. Cancer, the uncontrolled growth of cells, often results in a tumor, or mass of abnormal cells. Some cancerous tumors consist of many cells that are much smaller than normal. According to Model 1, what part(s) of the cell cycle is (are) most likely being affected?

During G₁ or M

7. In Model 1, if the length of the arrow represents time, then for those cancerous cells, what happens to the time that is necessary for the cell cycle? What implication might this have for doctors who are treating cancer patients?

The time decreases because the time needed for G also decreases. This means that the treatment process needs to be as soon as possible and occur as efficiently as possible because cancer cells can grow and spread a lot faster than normal cells.

Model 1 – The Cell Cycle

Roles of Cell Cycle Regulation in Female Reproduction: Analysis of the Cdk4-null Mouse David S. Moons, 2007

In order to identify unique roles for Cdk4 mice deficient for this protein were created Analysis of these mutant mice revealed tissue specific defects including female infertility Cdk4 deficient mice display defects that affect tissue function in not only the ovary and uterus but also the pituitary Analysis of the pituitary in Cdk4 null mice indicated anterior pituitary hypoplasia specific to the Pit1 dependent cell lineages Hypoproliferation was also observed in lactotrophs of adult Cdk4 null female mice in response to estrogen The role of Cdk4 in the ovary is distinct from that of its partner cyclin D2 in that Cdk4 is dispensable for granulosa cell proliferation while cyclin D2 is critical for this process Intriguingly similar to cyclin D2 null mice Cdk4 null mice display oocytes entrapped in differentiated corpora lutea suggesting a unique role for cyclin D2 Cdk4 in the process of ovulation Cdk4 null mice also display luteal insufficiency that appears to be secondary to defective PRL secretion resulting from the pituitary hypoplasia since injection of Cdk4 null mice with exogenous PRL restored progesterone to wild type levels Analysis of the uterus indicates a rate limiting role of Cdk4 in endometrial stromal cell proliferation during the process of decidualization Although embryo implantation does not occur in Cdk4 deficient mice under normal conditions this appears to be the result of luteal insufficiency since injection of either progesterone or prolactin results in implantation in Cdk4 null mice The data presented in this thesis indicate that Cdk4 plays unique roles in various processes involved in female reproduction The female infertility appears to be the result of lactotroph hypoplasia that results in luteal failure thereby preventing implantation of the embryo
