

Conclusion:

The results of this experiment support the hypothesis by increasing the rate of change as the amount of extraction enzyme is increased. The enzyme increased overall from 25 ml. to 5 ml., causing the rate of change to increase from 0.0005 to 0.003. The extraction enzyme briefly affected to the hydrogen peroxide, separating it into water and oxygen. The hydrogen peroxide reacted with the guaiacol during its decomposition to produce the orange color in the solution. Errors could have been made in the incorrect measurement of reactants and the improper use of the colorimeter. In conclusion, the increase of an enzyme results in the increase in production of the components of its substrate. Improvements could have been made in testing even greater amounts of the extraction enzyme in order to obtain more conclusive results.

Discussion:

Does the substrate concentration influence the rate of reaction? Yes, with increased substrate concentration there is more available for the enzyme to catalyze and the reaction rate will increase.
