In **symbiosis**, two or more species live together in a close, long-term association. Symbiotic relationships can be beneficial to both organisms or may benefit one organism and harm the other harmed or unaffected. **Parasitism** is one type of symbiotic relationship that is detrimental to, or harms, the host organism. In this relationship, one organism feeds on and usually lives in another, typically larger, organism. **Mutualism** is a symbiotic relationship in which both participating species benefit. A well-known instance of mutualism involves ants and aphids. The ants feed on fluid the aphids secrete, and in exchange, the ants protect the aphids from insect predators. A third form of symbiosis is **commensalism**, a symbiotic relationship in which one species benefits and the other is neither harmed nor helped. Among the best-known examples of commensalism are the feeding and protection relationships between certain small tropical fishes and sea anemones, marine animals that have stinging tentacles.
