Springer Handbook of Wood Science and Technology Peter Niemz, Alfred Teischinger, Dick Sandberg, 2023-04-01

This handbook provides an overview on wood science and technology of unparalleled comprehensiveness and international validity. It describes the fundamental wood biology, chemistry and physics as well as structure-property relations of wood and wood-based materials. The different aspects and steps of wood processing are presented in detail from both a fundamental technological perspective and their realisation in industrial contexts. The discussed industrial processes extend beyond sawmilling and the manufacturing of adhesively bonded wood products to the processing of the various wood-based materials including pulp and paper, natural fibre materials and aspects of bio-refinery. Core concepts of wood applications, quality and life cycle assessment of this important natural resource are presented. The book concludes with a useful compilation of fundamental material parameters and data as well as a glossary of terms in accordance with the most important industry standards. Written and edited by a truly international team of experts from academia, research institutes and industry, thoroughly reviewed by external colleagues, this handbook is well attuned to educational demands as well as providing a summary of state-of-the-art research trends and industrial requirements. It is an invaluable resource for all professionals in research and development and engineers in practice in the field of wood science and technology.

This accessible new edition explores the major topics in Monte Carlo simulation. Simulation and the Monte Carlo Method, Second Edition, reflects the latest developments in the field and presents a fully updated and comprehensive account of the major topics that have emerged in Monte Carlo simulation since the publication of the classic First Edition over twenty-five years ago. While maintaining its accessible and intuitive approach, this revised edition features a wealth of up-to-date information that facilitates a deeper understanding of problem solving across a wide array of subject areas such as engineering, statistics, computer science, mathematics and the physical and life sciences. The book begins with a modernized introduction that addresses the basic concepts of probability, Markov processes and convex optimization. Subsequent chapters discuss the dramatic changes that have occurred in the field of the Monte Carlo method with coverage of many modern topics including Markov Chain Monte Carlo, Variance reduction techniques such as the transform, likelihood ratio method and the screening method, the score function method for sensitivity analysis, the stochastic approximation method and the stochastic counter-part method for Monte Carlo optimization, the cross entropy method to rare events estimation and combinatorial optimization. Application of Monte Carlo techniques for counting problems with an emphasis on the parametric minimum cross entropy method. An extensive range of exercises is provided at the end of each chapter with more difficult sections and exercises marked accordingly for advanced readers. A generous sampling of applied examples is positioned throughout the book, emphasizing various areas of application and a detailed
