

Dragon Genetics

— Independent Assortment and Genetic Linkage

Hereditary traits (morphological and physiological characteristics) follow predictable patterns of inheritance, and the laws governing these patterns (Mendel's experiments on *Pisum sativum*) are extremely powerful tools for understanding how traits are passed.

In this activity you will study the patterns of inheritance of multiple genes in (imaginary) dragons. These dragons have two pairs of homologous chromosomes in each cell. You will see that, since genes are carried on chromosomes, the patterns of inheritance are determined by the behavior of chromosomes during mitosis and fertilization.

The Law of Independent Assortment — Inheritance of Genes on Different Chromosomes

For this activity, we will only consider one gene on each chromosome. These genes are described in the following table.

	Dominant Alleles	Recessive Alleles
Chromosome 1	W = long wings	w = no wings
Chromosome 2	H = big horns	h = small horns

The mother dragon is heterozygous for the wing gene (Ww) and the horn gene (Hh). The father is homozygous recessive for the wing gene (ww) and the horn gene (hh). What phenotypic traits will each parent have? (Homozygous traits are the observable bodily characteristics.) Draw the appropriate characteristics for each parent.

Mother

Father

Review of Inheritance of Single Genes

Draw a Punnett Square to show the inheritance of the horn alleles for a mating between this mother and father.

On average, what fraction of the baby dragons will have big horns?

¹ Mendel's first experiments used pea plants (*Pisum sativum*). A flower color gene and a gene for seed shape were used. Mendel's experiments showed that the inheritance of these traits followed the same patterns as the inheritance of the traits in the pea plants. Mendel's experiments are described in <http://www.ck12.org/section/mendels-experiments/>.
