Exposure to the building material asbestos has been linked to certain types of cancers. Asbestos causes mutations in the p53 gene, which controls tumor suppression.

1. Which statement best explains why people with cancer due to asbestos exposure do not pass the mutation on to their offspring?
 - a. The mutation occurred in somatic cells.
 - b. The mutation occurred in germline cells.
 - c. The mutation is recessive.
 - d. The mutation is sex-linked.

The inheritance pattern for an autosomal dominant trait is shown in the pedigree. Shaded symbols represent individuals that express the **dominant trait**. Use the pedigree to answer question #2.

2. Select the correct interpretation of genotypes from the pedigree above.
 - a. I-1: aa I-2: Aa
 - b. I-1: AA I-2: Aa
 - c. I-1: Aa I-2: aa
 - d. I-1: aa I-2: AA
3. Tomato plants usually have hairy stems. Hairless stems are present in tomato plants that are heterozygous recessive for the trait. If this characteristic is determined by a single gene, what is the expected outcome of crossing two tomato plants that are heterozygous for hairy stems?
 - a. 75% hairy stems, 25% hairless stems
 - b. 100% hairy stems
 - c. 100% hairless stems
 - d. 50% hairy stems, 50% hairless stems
4. Hemophilia is a sex-linked, recessive trait. Which of the following describes the probability of hemophilia in the offspring of a man who does not have hemophilia and a woman who is a heterozygous carrier?
 - a. There is a 100% chance that their sons will have hemophilia.
 - b. There is a 50% chance that their daughters will have hemophilia.
 - c. There is a 25% chance that their sons will have hemophilia.
 - d. There is a 50% chance that their daughters will have hemophilia.

Rosenberg, TVOntario, 1985 *Protein Biosynthesis in Eukaryotes* R. Perez-Bercoff, 2012-07-01 vi The word protein coined one and a half century ago from the 17th century to the proteins of primary importance underlines the primary importance ascribed to proteins from the time they were described as biochemical entities But the unmatched complexity of the process involved in their biosynthesis was understandably overlooked Indeed protein biosynthesis was supposed to be nothing more than the reverse of protein degradation and the same enzymes known to split a protein into its constituent amino acids were thought to be able under adequate conditions to reconstitute the peptide bond This oversimplified view persisted for more than 50 years It was just in 1940 that Borsook and Dubnoff examined the thermodynamical aspects of the process and concluded that protein synthesis could not be the reverse of protein degradation such an uphill task being thermodynamically impossible The next quarter of a century witnessed the unravelling of the basic mechanisms of protein biosynthesis a predictable aftermath of the Copernican revolution in biology which followed such dramatic developments as the discovery of the nature of the genetic material the double helical structure of DNA and the determination of the genetic code Our present understanding of the sophisticated mechanisms of regulation and control is a relatively novel acquisition and recent studies have shed some light into the structure and organization of the eukaryotic gene Study of Cell-free Protein Synthesis ,1903 Cell-Free Protein Synthesis Kirill Alexandrov, Wayne A.
