Troffaes,Gert de Cooman,2014-04-09 This book has two main purposes On the one hand it provides a concise and systematic development of the theory of lower previsions based on the concept of acceptability in spirit of the work of Williams and Walley On the other hand it also extends this theory to deal with unbounded quantities which abound in practical applications Following Williams we start out with sets of acceptable gambles From those we derive rationality criteria avoiding sure loss and coherence and inference methods natural extension for unconditional lower previsions We then proceed to study various aspects of the resulting theory including the concept of expectation linear previsions limits vacuous models classical propositional logic lower oscillations and monotone convergence We discuss n monotonicity for lower previsions and relate lower previsions with Choquet integration belief functions random sets possibility measures various integrals symmetry and representation theorems based on the Bishop De Leeuw theorem Next we extend the framework of sets of acceptable gambles to consider also unbounded quantities As before we again derive rationality criteria and inference methods for lower previsions this time also allowing for conditioning We apply this theory to construct extensions of lower previsions from bounded random quantities to a larger set of random quantities based on ideas borrowed from the theory of Dunford integration A first step is to extend a lower prevision to random quantities that are bounded on the complement of a null set essentially bounded random quantities This extension is achieved by a natural extension procedure that can be motivated by a rationality axiom stating that adding null random quantities does not affect acceptability In a further step we approximate unbounded random quantities by a sequences of bounded ones and in essence we identify those for which the induced lower prevision limit does not depend on the details of the approximation We call those random quantities previsible We study previsibility by cut sequences and arrive at a simple sufficient condition For the 2 monotone case we establish a Choquet integral representation for the extension For the general case we prove that the extension can always be written as an envelope of Dunford integrals We end with some examples of the theory **Basic and Advanced Bayesian Structural Equation Modeling** Sik-Yum Lee,Xin-Yuan Song,2012-07-05 This book provides clear instructions to researchers on how to apply Structural Equation Models SEMs for analyzing the inter relationships between observed and latent variables Basic and Advanced Bayesian Structural Equation Modeling introduces basic and advanced SEMs for analyzing various kinds of complex data such as ordered and unordered categorical data multilevel data mixture data longitudinal data highly non normal data as well as some of their combinations In addition Bayesian semiparametric SEMs to capture the true distribution of explanatory latent variables are introduced whilst SEM with a nonparametric structural equation to assess unspecified functional relationships among latent variables are also explored Statistical methodologies are developed using the Bayesian approach giving reliable results for small samples and allowing the use of prior information leading to better statistical results Estimates of the parameters and model comparison statistics are
