Research in linguistics as in most other scientific domains is usually approached in a modular way narrowing the domain of inquiry in order to allow for increased depth of study This is necessary and productive for a topic as wide ranging and complex as human language However precisely because language is a complex system tied to perception learning memory and social organization the assumption of modularity can also be an obstacle to understanding language at a deeper level This book examines the consequences of enforcing non modularity along two dimensions the temporal and the cognitive Along the temporal dimension synchronic and diachronic domains are linked by the requirement that sound changes must lead to viable stable language states Along the cognitive dimension sound change and variation are linked to speech perception and production by requiring non trivial transformations between acoustic and articulatory representations The methodological focus of this work is on computational modeling By formalising and implementing theoretical accounts modeling can expose theoretical gaps and covert assumptions To do so it is necessary to formally assess the functional equivalence of specific implementational choices as well as their mapping to theoretical structures This book applies this analytic approach to a series of implemented models of sound change As theoretical inconsistencies are discovered possible solutions are proposed incrementally constructing a set of sufficient properties for a working model Because internal theoretical consistency is enforced this model corresponds to an explanatorily adequate theory And because explicit links between modules are required this is a theory not only of sound change but of many aspects of phonological competence The book highlights two aspects of modeling work that receive relatively little attention the formal mapping from model to theory and the scalability of demonstration models Focusing on these aspects of modeling makes it clear that any theory of sound change in the specific is impossible without a more general theory of language of the relationship between perception and production the relationship between phonetics and phonology the learning of linguistic units and the nature of underlying representations Theories of sound change that do not explicitly address these aspects of language are making tacit untested assumptions about their properties Addressing so many aspects of language may seem to complicate the linguist's task However as this book shows it actually helps impose boundary conditions of ecological validity that reduce the theoretical search space

Tommasi, 2017-04-28 Aftereffects generally occur after a prolonged exposure adaptation to a first stimulus possessing one given property followed by presentation of a stimulus bearing a neutral value of that property The aftereffect consists in a change in appearance of the neutral stimulus following the adapter compared to the appearance of the neutral stimulus when it is perceived without any previous exposure to the adapter The transient phenomena of perceptual aftereffects are believed to depend on the activation of neuron populations that respond selectively to a given property of the stimuli Studying how adaptation occurs which stimulus properties are sensitive to it which timings are necessary whether individual differences modulate its occurrence has thus become an indirect way to probe the plasticity of sensory functions in the nervous system recently extending to more cognitive and representational aspects of neural coding In the last two decades indeed it has been demonstrated that aftereffects occur not only for low level properties of stimuli such as motion color or orientation but also for high level properties Many studies have proven that high level proprieties of the stimuli e g gender identity ethnicity or age of a face or a voice are sensitive to this phenomenon It has been shown for example that the prolonged exposure to a female or male face produces a gender misperception in the opposite direction when an androgynous face is shown after the adapter Furthermore recent studies have also shown that aftereffects are not strictly contingent upon the physical features that make up stimuli but they seem to run across the high level proprieties subjects are adapted to These evidences are supported by cross category adaptation studies which underlie how aftereffects occur even across stimuli that do not share physical features e g bodies and faces but that instead share common higher level properties such as gender Given the growing body of research focused on adaptation and aftereffects in high level perception at the boundaries with perceptual learning attention and cognition the purpose of this topic is to provide a picture of the state of the art relative to the specific phenomena of adaptation in high level perceptual processing , **Excellence in University Assessment** David
