**Abelian Groups and Noncommutative Rings: A Collection of Papers in Memory of Robert B. Warfield, Jr.** László

Fuchs, 1992 This collection of research papers is dedicated to the memory of the distinguished algebraist Robert B Warfield Jr. Focusing on abelian group theory and noncommutative ring theory the book covers a wide range of topics reflecting Warfield's interests and includes two articles surveying his contributions to mathematics. Because the articles have been refereed to high standards and will not appear elsewhere this volume is indispensable to any researcher in noncommutative ring theory or abelian group theory. With papers by some of the major leaders in the field this book will also be important to anyone interested in these areas as it provides an overview of current research directions. The Mathematics of Paul Erdős I

Ronald L. Graham, Jaroslav Nešetřil, Steve Butler, 2013-08-04 This is the most comprehensive survey of the mathematical life of the legendary Paul Erdős 1913-1996 one of the most versatile and prolific mathematicians of our time. For the first time all the main areas of Erdős's research are covered in a single project. Because of overwhelming response from the mathematical community the project now occupies over 1000 pages arranged into two volumes. These volumes contain both high level research articles as well as key articles that survey some of the cornerstones of Erdős's work each written by a leading world specialist in the field. A special chapter 'Early Days' rare photographs and art related to Erdős complement this striking collection. A unique contribution is the bibliography on Erdős's publications the most comprehensive ever published. This new edition dedicated to the 100th anniversary of Paul Erdős's birth contains updates on many of the articles from the two volumes of the first edition several new articles from prominent mathematicians a new introduction more biographical information about Paul Erdős and an updated list of publications. The first volume contains the unique chapter 'Early Days' which features personal memories of Paul Erdős by a number of his colleagues. The other three chapters cover number theory random methods and geometry. All of these chapters are essentially updated most notably the geometry chapter that covers the recent solution of the problem on the number of distinct distances in finite planar sets which was the most popular of Erdős's favorite geometry problems. **Mathematics of Complexity and Dynamical Systems** Robert A. Meyers, 2011-10-05

**Mathematics of Complexity and Dynamical Systems** is an authoritative reference to the basic tools and concepts of complexity systems theory and dynamical systems from the perspective of pure and applied mathematics. Complex systems are systems that comprise many interacting parts with the ability to generate a new quality of collective behavior through self-organization e.g. the spontaneous formation of temporal spatial or functional structures. These systems are often characterized by extreme sensitivity to initial conditions as well as emergent behavior that are not readily predictable or even completely deterministic. The more than 100 entries in this wide-ranging single source work provide a comprehensive explication of the theory and applications of mathematical complexity covering ergodic theory fractals and multifractals dynamical systems perturbation theory solitons systems and control theory and related topics. **Mathematics of Complexity and Dynamical Systems** is an essential reference for all those interested in mathematical complexity from undergraduate and
