construction buildability environmental assessment tools used in the design performance in terms of energy air tightness carbon footprint and post occupancy issues The policy context of energy and sustainability in the UK Europe and the rest of the world is subjected to a critical examination to show how this affects the use of natural and renewable materials in the market for insulation and other construction materials The debate over energy usage and embodied energy is discussed as this is central to the reason why even many environmentally progressive people ignore the case for natural and renewable materials The book offers a discussion of building physics and science considering energy performance moisture durability health and similar issues A critical evaluation of assessment accreditation and labelling of materials and green buildings is central to this as well as a review of some of the key research in the field

Hopefully this book will be taken off of the shelf frequently to be studied carefully over many years More than 40 researchers were involved in this project which examines respiration circulation and metabolism from sh to the land vertebrates including human beings A breathable and stable atmosphere rst appeared about 500 million years ago Oxygen levels are not stable in aquatic environments and exclusively water breathing sh must still cope with the ever changing levels of O₂ and with large temperature changes This is reflected in their sophisticated count current systems with high O₂ extraction and internal and external O₂ receptors 2 2 The conquest for the terrestrial environment took place in the late Devonian period 355 359 million years ago and recent discoveries portray the gradual transitional evolution of land vertebrates The oxygen rich and relatively stable atmospheric conditions implied that oxygen sensing mechanisms were relatively simple and gain compared with acid base regulation Recently physiology has expanded into related fields such as biochemistry molecular biology morphology and anatomy In the light of the work in these fields the introduction of DNA based cladograms which can be used to evaluate the likelihood of land vertebrates and lung sh as a sister group could explain why their cardio respiratory control systems are similar The diffusing capacity of a duck lung is 40 times higher than that of a toad or lung sh Certainly some animals have evolved to rich high performance levels
