©Harvard Medical School 2009

Our organisms manufacture antibodies continuously to deal with the various environmental challenges. Among others, when foreign and/or self proteins/peptides contribute to the body's health, they become antigens. Antibody cell identification, pathogenesis of disease and immunologic tests: a complex but fascinating process that will be discussed in this lecture. Here, we will introduce the classification of blood antigens.

Model 1 – Red Blood Cells and Antibodies

	Person with Blood Type A	Person with Blood Type B	Person with Blood Type AB	Person with Blood Type O
Cells with surface antigen				
Antibody present				
Cells in the presence of anti-A antibody				
Cells in the presence of anti-B antibody				

1. Blood types in the human population are characterized by the presence or absence of **antigens** on the surface of their red blood cells.

a. How many of Model 1, body using blood types are found in the human population?

b. Which antigen is used in Model 1 to represent an **antigen**?

c. What relationship is type A with blood and how is type B and blood type?

Xenotransplantation David K.C. Cooper,Ejvind Kemp,Keith Reemtsma,D.J.G. White,2012-12-06 The cover of this book depicts a Lamassu one of the fabulous beasts of mythology 1 Like many similar creatures such as the Chimera Griffon Hippocamp and Cockatrice the body of the Lamassu was clearly a combination of structures derived from several different species in other words it provides a highly successful example of xenotransplantation But in selecting a symbol of xenotransplantation to grace the cover of this volume why choose the Lamassu in preference to the other ancient beasts The reason is that the Lamassu appears to have been endowed with a much Fig I Homer described the Chimera as consisting of a lion's foreparts a goat in the middle and a serpent's hind parts VIII Foreword Fig 2 The Griffon had the foreparts of an eagle and the rear tail and hindlegs of a lion Its eagle like head had pointed upstanding ears like those of an ass Feathers grew upon its head neck and chest and the rest of its body was covered in leonine fur more benign and desirable character than many of its mythological associates For example reliable reports state that the Chimera Fig 1 hitherto the animal most commonly selected to symbolize xenografting killed everyone who came within range of its fiery breath Perhaps not surprisingly therefore the Chimera is variously described as one of the largest monsters ever born a savage creature and a symbol of complex evil

Clinical Xenotransplantation David K. C. Cooper,Guerard Byrne,2020-09-08 This title provides an illuminating examination of the current state of xenotransplantation grafting or transplanting organs or tissues between members of different species and how it might move forward into the clinic To be sure this is a critical topic as a major problem that remains worldwide is an inadequate supply of organs from deceased human donors severely limiting the number of organ transplants that can be performed each year Based on presentations given at a major conference on xenotransplantation this title includes important views from many leading experts who were invited to present their data and opinions on how xenotransplantation can advance into the clinic Attention

was concentrated on pig kidney and heart transplantation as it is in regard to these organs that most progress has been made Collectively these chapters effectively highlight the many advantages of xenotransplantation to patients with end stage organ failure thereby encouraging the mapping of a concrete pathway to clinical xenotransplantation The book is organized across 22 chapters beginning with background information on clinical and experimental xenotransplantation Following this are discussions addressing how pigs can be genetically engineered for their organs to be resistant to the human immune response through deletion of pig xenoantigens and the insertion of protective human transgenes Subsequent chapters analyze complications that arise in practice comparing allotransplant and xenotransplant rejection The selection of the ideal patients for the first clinical trials is discussed Finally the book concludes with an analysis on the regulatory economic and social aspects of this research including FDA perspectives and the sensitive psychosocial factors regarding allotransplantation and xenotransplantation A major and timely addition to the literature Clinical Xenotransplantation will be of great interest to all researchers physicians and academics from other disciplines with an interest in xenotransplantation

Somatic cells can be reprogrammed into induced pluripotent stem cells by the expression of specific transcription factors. These cells are transforming biomedical research in the last 15 years. The volume teaches readers about current advances in the field. This book describes the use of induced pluripotent stem cells to form different cell types which can be used in cell therapy as well as to model several diseases in vitro enabling us to study the cellular and molecular mechanisms involved in different pathologies. In recent years remarkable progress has been made in the obtention of induced pluripotent stem cells and their differentiation into several cellular populations, tissues and organs using state of art techniques. This volume will cover what we know so far about the use of iPSCs to derive different cell types such as erythroid cells, mucosal associated invariant T cells, megakaryocytes, cerebral cortical neurons, inner ear cell types, airway epithelial cells, male germ cells, trophoblasts, cardiomyocytes, pancreatic cells and more. The volume is written for researchers and scientists interested in stem cell therapy, cell biology, regenerative medicine and organ transplantation and is contributed by world renowned authors in the field. Provides overview of the fast moving field of induced pluripotent stem cell technology, regenerative medicine and therapeutics. Covers the following cell types derived from iPSCs: erythroid cells, mucosal associated invariant T cells, megakaryocytes, cerebral cortical neurons, inner ear cell types, airway epithelial cells, male germ cells, trophoblasts, cardiomyocytes, pancreatic cells and more. Contributions from stem cell leaders around the world.

Glycoimmunology in Xenotransplantation Cheorl-Ho Kim, 2024-02-20 This book describes general glycobiology in emphasizing the structures, biosynthesis, glycosylation and distribution of the glycans and xenogenic glycoantigens in eukaryotic cells of mammals including mouse, swine, chimpanzee and human. In the middle I have focused on topics in xenotransplantation, glycobiology and expand descriptions of allogenic and xenoantigenic transplantation to open the dawn in insights into the origin of life. One of the biological diversity named species diversity is a phenomenon environmentally adapted from the evolutionary process for long period. The distinct structures of glycans discriminate each organism and are the essential molecular basis of the discrimination and difference between the organisms giving an incompatibility between the different species. Diversity and variations in carbohydrate chain structures between family, species, kingdoms and domains mark the global pattern and signs of immune self and non self recognition. In human diversity in ABH blood group antigens is observed in human family and this type pattern distinguishes individuals from a pan family to a non dividable unit of the family. Blood transfusion and organ transplantation are impossible even in the allogenic cross between humans if carbohydrates are ignored. This explains how and how human beings are a lonely existence. ABH related antibodies induce hemolysis or

hyperacute or allograft rejection due to incompatible graft property even between the same species The incompatibility is an immunologic rejection when the recipient host receives the tissues or organs from the different species of donors as well known in pig to human xenotransplantation The immunologic incompatibility between the donor pigs and the recipient human are based on the evolutionary distance between pigs and humans This distance allows a xenograft rejection between the 2 mammals Modification or deletion of the specific gene locus for immune rejection on genome of donor animals disrupts the immunological recognition ligands of the donor organs consequently preventing the immune rejection of the human recipient and xenograft rejection This book helps undergraduate and graduate students researcher and professors who are involved in the glycobiology and xenoantigenic biology with recent advances in the xenotransplantation basic and clinic
