Cells and Tissues An Introduction to Histology and Cell Biology begins by explaining why histology should be studied Some chapters follow on the techniques for studying cells and tissues the anatomy of the cell the epithelia the

connective tissues and the blood This book also covers topics on the immunity against foreign material contractility specifically at how it is brought about and at how the system changes in a stationary cell and harnessing of contraction to produce movement This text also looks into the communication systems within cells the life and death of cells and the histological sections of small intestine The responses of the body to injury in the processes of inflammation and repair are also explored This book will be useful to students starting in histology though it does assume some elementary knowledge of biochemistry and of the structure of the mammalian body     *Human Anatomy Laboratory Manual with Cat Dissections* Elaine Nicpon Marieb, 2001 textformat 02 With 29 exercises covering all body systems a clear engaging writing style and full color illustrations this thoroughly updated edition offers readers everything needed for a successful lab experience For college instructors and students     Developments in Bovine Immunology - An Integrated View Kieran G. Meade, 2015-07-22 The world's population is predicted to hit 9 Billion by 2050 and with it food demand is predicted to increase substantially The World Bank estimates that cereal and meat production needs to increase by 50% and 85% respectively between 2000 and 2030 to meet demand putting serious pressure on the global agricultural industry Critical to meeting this demand for food are mechanisms to reduce the incidence of animal disease With in excess of 1.3 billion cattle globally the total cost of infectious diseases is difficult to estimate However in North America alone the cost is predicted to be 18 billion annually Non infectious diseases also account for another major impediment to the production capacity and welfare of animals as well as the economic sustainability of farming However animal diseases have implications that spread far beyond the farm gate Infectious agents can also contaminate the food chain and potentially affect human health Controlling diseases through better preventative and treatment methods requires a detailed understanding of the immune response in livestock species Multiple studies have identified associations between variation in immune genes and disease susceptibility which potentially opens up new avenues to select animals with superior disease resistance Detailed understanding of immunity in cattle is leading to the design of more effective vaccines Furthermore appreciation of the significant differences between rodent and human immune responses has also led to bovine models being developed for some human diseases The publication of the bovine genome and the advent of next generation sequencing technologies have facilitated a massive expansion in our knowledge of the immune response in cattle As a result there has been an explosion of exciting research findings including in metagenomics and epigenetics Recently there has been a welcome move to integrate our emerging understanding of the immune response with detailed studies of other important physiological processes including nutrition and reproduction The interactions between the reproductive system nutrition and the immune system are of particular interest since each places significant demands on the animal at various stages through the production cycle The interplay between these morphologically diffuse systems involves widely distributed chemical signals in response to environmental input and each system must interact for the normal functioning of the other A comprehensive systems approach is improving our

understanding of normal physiological interactions between these systems and furthermore how dysregulation can lead to disease The successful translation of bovine immunological research into improved treatments for animal disease requires tight interaction between diverse scientific and clinical disciplines including immunology microbiology endocrinology physiology nutrition reproduction and clinical veterinary medicine With so much recent progress in the field we believe that it is valuable and well timed to review the broad variety of the relevant studies that attempt to increase our understanding through comprehensive collaboration between these disciplines We are looking forward to a wide and vivid discussion of developments in bovine immunology and related issues and we expect that our readers profoundly benefit from new exciting insights and fruitful collaborations
