temperatures substantially lower than the passive regeneration temperature Furthermore by introducing these simulated reformates using a periodic injection strategy it was evident that similar benefits to the regeneration process could be attained with significantly less volumes of simulated reformates In an attempt to effectively utilise the carbon monoxide generated during hydrogen production by an exhaust gas fuel reformer this study defined an optimised hydrogen carbon monoxide mixture ratio of 60% v v hydrogen balanced with carbon monoxide At this optimised mixture ratio the filter demonstrated the highest regeneration efficiency of all ratios tested Such data could be utilised in future work in the development of fuel reformer design

Modeling of Diesel Particulate Filter Filtration and Regeneration for Transient Driving Schedules Di Huang,2011

Passive Regeneration Michael James Bahr (Nav. E.),Massachusetts Institute of Technology. Department of Mechanical Engineering,2013 Diesel particulate filters DPF have seen widespread growth as an effective means for meeting increasingly rigorous particle emissions regulations There is growing interest to exploit passive regeneration of DPFs to reduce fuel consumption accompanying traditional active regeneration Incombustible material or ash mainly derived from metallic additives in the engine lubricant accumulates in the DPF over time This ash accumulation increases flow restriction and rise in pressure drop across the DPF The growth of pressure drop adversely impacts engine performance and fuel economy This study built upon previous research to evaluate the different effects of regeneration strategy on ash packing and distribution within DPFs Since passive regeneration relies on a catalyzed reaction the interactions of ash with the catalyst will play an important role Passive regeneration is specifically dependent on exhaust feed gas composition exhaust conditions including temperature and flow rate catalyst type and configuration and the state of DPF loading during prior to passive regeneration The goal of the study is to address the long term effects of regeneration parameters on ash accumulations and the resulting impact of ash on the DPF catalyst performance Experiments were conducted that focused on pressure drop measurements over the lifetime of diesel particulate filters with different regeneration methods coupled with post mortem ash characterization These experiments provide insight to how these regeneration methods impact the DPF performance These results among few fundamental data of this kind correlate changes in diesel particulate filter performance with exhaust conditions regeneration strategy and ash morphological characteristics Outcomes are useful in optimizing the design of the combined engine aftertreatment lubricant system for future diesel engines balancing the necessities of additives for adequate engine protection with the requirements for robust aftertreatment systems

Experiments and Analysis of DPF Loading and Regeneration ,2000 Particulate filter system consists of a filter and a regeneration strategy Commercial filters are very effective at removing PM but regeneration is a challenge In addition to removal of PM it is important to reduce other pollutants including NO from diesel engine exhaust Particulate filter regeneration strategy can include catalysts fuel
