ASA S3/SC1.4 TR-2014 Sound Exposure Guidelines for Fishes and Sea Turtles: A Technical Report prepared by ANSI-Accredited Standards Committee S3/SC1 and registered with ANSI Arthur N. Popper, Anthony D. Hawkins, Richard R. Fay, David A. Mann, Soraya Bartol, Thomas J. Carlson, Sheryl Coombs, William T. Ellison, Roger L. Gentry, Michele B. Halvorsen, Svein Løkkeborg, Peter H. Rogers, Brandon L. Southall, David G. Zeddis, William N.

Tavolga, 2014-07-07 This Technical Report presents the outcome of a Working Group that was established to determine broadly applicable sound exposure guidelines for fishes and sea turtles After consideration of the diversity of fish and sea turtles guidelines were developed for broad groups of animals defined by the way they detect sound Different sound sources were considered in terms of their acoustic characteristics and appropriate metrics defined for measurement of the received levels The resultant sound exposure guidelines are presented in a set of tables In some cases numerical guidelines are provided expressed in appropriate metrics When there were insufficient data to support numerical values the relative likelihood of effects occurring was evaluated although the actual likelihood of effects depends on the received level These sound exposure guidelines which are based on the best scientific information at the time of writing should be treated as interim The expectation is that with more research the guidelines can be refined and more cells in the tables completed Recommendations are put forward defining the research requirements of highest priority for extending these interim exposure guidelines

dam removal and ecosystem restoration Rebecca McCaffery, Laura Soissons, Jeffrey J. Duda, Jean-Marc Roussel, 2024-09-20 Rivers are vital ecosystems that support aquatic and terrestrial biodiversity and several ecosystem services including food water culture and recreation After centuries of building dams on rivers across the world dam removal projects are now on the rise due to obsolescence reservoir sedimentation insufficient return on investment or river restoration and conservation priorities Most dam removal projects have focused on smaller structures 10 m in structural height but larger structures have also started to be removed in increasing numbers as practitioners river managers conservationists and the public have gained more experience with the practice Recent estimates suggest that only a small fraction of dam removals have been scientifically studied and include mostly small dams and short time scales Documenting the long term ecological outcomes of large dam removal i.e. 10 m tall represents a new frontier in dam removal research projects are more recent and provide an opportunity to understand the complex ecological changes that occur with these transformative restoration projects Here we aim to collate a diverse array of papers on long term dam removal research projects involving larger dams 10 m to synthesize the issues outcomes tools and experimental designs used to study large dam removal projects from physical biological and ecological perspectives With this collection we aim to showcase diverse global projects on ecosystem responses to large dam removal collect perspectives from different disciplines fields and geographies and synthesize the current state of knowledge in this area We expect that this Research Topic will be informative to ongoing long term ecological restoration and monitoring projects related to dam removal as well as to upcoming large dam removal projects We welcome contributions from all disciplines addressing the physical ecological and ecosystem responses to large scale dam removal Contributions could include original research in a specific discipline or area case studies or synthesis papers that address one or more of these topics in a transdisciplinary approach Contributors could address any of the following major topics as related to outcomes of large dam removal alone or in combination Freshwater estuarine and marine aquatic biota River and reservoir geomorphology Terrestrial and riparian vegetation Wildlife Sedimentation and Modelling We would like contributors to highlight key results in their area of study cross disciplinary insights and lessons learned that could inform ongoing monitoring and research efforts in current projects as well as upcoming large dam removals **The Economics of**

Protected Marine Species: Concepts in Research and Management Kristy Wallmo, Kathryn Bisack, Daniel K. Lew, Dale

E. Squires, 2016-10-21 Protected marine species have populations that are depleted decreasing or are at risk of extinction or local extirpation As of 2015 The International Union for the Conservation of Nature a global environmental organization lists approximately 737 marine species worldwide that are considered at risk of extinction Many are provided legal protection through national laws requiring research and management measures aimed at recovering and maintaining the species at a sustainable population level Integral to the policy decision process involving the management and recovery of marine species is the consideration of trade offs between the economic and ecological costs and benefits of protection This suggests that economics at its core the study of trade offs has a significant role In the U S a somewhat traditional use of economics in protected species research and management has involved cost minimization or cost effectiveness analyses to help select or prioritize conservation actions Economic research has also provided estimates of public non market benefits of recovering species which can be used in larger management frameworks such as ecosystem based management and coastal and marine spatial planning Inherent in much of this research however are complex biological and ecological relationships in which varying degrees of scientific uncertainty are present Addressing this type of uncertainty can affect the economic outcomes related to protected species For example recent work suggests that increasing scientific precision in biological sampling and models can greatly affect the magnitude of economic benefits to commercial fisheries while other research suggests that public non market benefits of species recovery are sensitive to uncertainty about baseline population estimates Previous research has illustrated the importance of understanding the biological ecological and economic aspects of protected species management and recovery In this research topic we synthesize current protected marine species economic research and expand the discussion on present and future challenges related to protected species economics The series of manuscripts brings together an array of prominent researchers and advances our understanding of the ecological and economic aspects of managing and recovering protected marine species

Rebounding Marine Mammal Species and Conservation Recovery Challenges Andrea Bogomolni, Kristina Cammen, Jennifer Jackman, 2025-03-19 Marine mammals have been valued for millennia for their cultural significance and more often their exploitative resource value Many large whale species remain imperilled or are only recently returning from the brink of extinction In contrast recent conservation measures have allowed for the successful rebound and recovery of many cetaceans and pinniped species some to the point of perceived overabundance whether referring to 1 200 Hawaiian monk seals or 7 million harp seals In addition to their continued intrinsic value alive and thriving today we also appreciate the value of marine mammal species to ecosystem health Yet as we grapple with a lack of historical baselines and uncertain ecological and social carrying capacities several conflicts are emerging at the growing interface between humans and marine mammals These conflicts include ship strikes depredation bycatch impacts of ecotourism competition for resources changing

cultural values and political challenges to marine mammal conservation Despite the emergence of theory and application of human dimensions of wildlife in the terrestrial realm the rebound of marine mammals and how we address these conflicts in the coastal and ocean environment are often overlooked when discussing human wildlife conflict issues and solutions This Research Topic aims to increase awareness of these issues to advance the discussion on how we can address these challenges in ocean systems Conflicts with rebounding populations of marine mammals have emerged across diverse ecological sociological economic and political contexts Conflicts often arise from assessing how marine mammals fit into the human world based on the baseline understanding of one s own personal experiences or specific community contexts rather than broader and complex ecosystems understanding or historical context How do we address these emerging complex socio ecological problems related to marine mammals Who defines the problems and how are the problems defined How do we consider often opposing values and interests in the development of solutions and how do we engage diverse stakeholders in decision making processes that shape how we will manage and coexist with marine mammal populations for generations to come How can different disciplines help build the knowledge foundation and strategies necessary to address these challenges
