

Model 2 – The Carbon Cycle

1. Model 2 illustrates three major processes which naturally occur:
 - a. **Carbon**
 - b. **Photosynthesis** (plants take up CO₂ from the atmosphere)
 - c. **Plant respiration and animals**
2. Photosynthesis is the process by which plants take up CO₂ from the atmosphere:
 - a. Label 1 in the diagram in Model 2 left to this natural process: **Photosynthesis**
 - b. Which organisms carry out this process? Identify its part in:
3. **Respiration**
 - a. Which natural process releases CO₂ from plants and animals? Identify its part in the diagram.
 - b. Which organisms in the cycle carry out this process?
4. **Decomposition**
 - a. Which natural process of decomposition releases CO₂?

It is almost always shown as a part of the cycle.

Land Carbon Cycle Modeling Yiqi Luo, Benjamin Smith, 2024-06-14 Carbon moves through the atmosphere through the oceans onto land and into ecosystems This cycling has a large effect on climate changing geographic patterns of rainfall and the frequency of extreme weather and is altered as the use of fossil fuels adds carbon to the cycle The dynamics of this global carbon cycling are largely predicted over broad spatial scales and long periods of time by Earth system models This book addresses the crucial question of how to assess evaluate and estimate the potential impact of the additional carbon to the land carbon cycle The contributors describe a set of new approaches to land carbon cycle modeling for better exploring ecological questions regarding changes in carbon cycling employing data assimilation techniques for model improvement doing real or near time ecological forecasting for decision support and combining newly available machine learning techniques with process based models to improve prediction of the land carbon cycle under climate change This new edition includes seven new chapters machine learning and its applications to carbon cycle research five chapters principles underlying carbon dioxide removal from the atmosphere contemporary active research and management issues one chapter and community infrastructure for ecological forecasting one chapter Key Features Helps readers understand implement and criticize land carbon cycle models Offers a new theoretical framework to understand transient dynamics of the land carbon cycle Describes a suite of modeling skills matrix approach to represent land carbon nitrogen and phosphorus cycles data assimilation and machine learning to improve parameterization and workflow systems to facilitate ecological forecasting Introduces a new set of techniques such as semi analytic spin up SASU unified diagnostic system with a 1 3 5 scheme traceability analysis and benchmark analysis and PROcess guided machine learning and DATA driven modeling PRODA for model evaluation and improvement Reorganized from the first edition with seven new chapters added Strives to balance theoretical considerations technical details and applications of ecosystem modeling for research assessment and crucial decision making

The Global Carbon Cycle and the Evolution of Photosynthesis Alexander A. Ivlev, 2019-11-05 The book deals with the problem of the interaction and interconditionality of the various processes occurring in both the Earth's crust and the biosphere It proposes a model of the global carbon cycle explaining the nature and mechanism of these interactions showing that the key element of this interaction is the photosynthesis controlled by periodic carbon dioxide injections caused by collision zones of lithospheric plates Changes in the environment due to the evolution of photosynthesis cause alterations in the carbon cycle and lead to a stationary state when new features of the cycle are manifested The main instruments of the analysis here are the isotopic technique and physico chemical modeling conducted on the basis of the principle of actualism The model provides explanations of periodic mass extinctions of organisms the explosions of life the uneven distribution of organic matter in the sedimentary strata stratigraphic oil distribution and various other events in the biosphere in the course of geological history The book will appeal to geologists geochemists climatologists ecologists biologists and specialists in global change

The Changing Carbon Cycle John R. Trabalka, David E. Reichle, 2013-03-09 The United States Government cognizant of its responsibilities to future generations has been sponsoring research for nine years into the causes effects and potential impacts of increased concentrations of carbon dioxide CO₂ in the atmosphere Agencies such as the National Science Foundation National Oceanic and Atmospheric Administration and the U S Department of Energy DOE cooperatively spent about 100 million from FY 1978 through FY 1984 directly on the study of CO₂ The DOE as the 2 lead government agency for coordinating the government's research efforts has been responsible for about 60% of these research efforts William James succinctly defined our purpose when he stated science must be based upon irreducible and stubborn facts Scientific knowledge can and will reduce the present significant uncertainty surrounding our understanding of the causes effects and potential impacts of increasing atmospheric CO₂ We have come far during the past seven years in resolving some underlying doubts and in narrowing the ranges of disagreement Basic concepts have become less murky Yet much more must be accomplished more irreducible and stubborn facts are needed to reduce the uncertainties so that we can improve our knowledge base Uncertainty can never be reduced to zero However with

a much improved knowledge base we will be able to learn under stand and be in a position to make decisions

The Phanerozoic Carbon Cycle Robert A. Berner,2004-08-19

The term carbon cycle is normally thought to mean those processes that govern the present day transfer of carbon between life the atmosphere and the oceans This book describes another carbon cycle one which operates over millions of years and involves the transfer of carbon between rocks and the combination of life the atmosphere and the oceans The weathering of silicate and carbonate rocks and ancient sedimentary organic matter including recent large scale human induced burning of fossil fuels the burial of organic matter and carbonate minerals in sediments and volcanic degassing of carbon dioxide contribute to this cycle In The Phanerozoic Carbon Cycle Robert Berner shows how carbon cycle models can be used to calculate levels of atmospheric CO₂ and O₂ over Phanerozoic time the past 550 million years and how results compare with independent methods His analysis has implications for such disparate subjects as the evolution of land plants the presence of giant ancient insects the role of tectonics in paleoclimate and the current debate over global warming and greenhouse gases
