E. M. Greitzer, C. S. Tan, M. B. Graf, 2007-02-26 This book describes the analysis and behaviour of internal flows encountered in propulsion systems fluid machinery compressors turbines and pumps and ducts diffusers nozzles and combustion

chambers The focus is on phenomena that are important in setting the performance of a broad range of fluid devices The authors show that even for complex processes one can learn a great deal about the behaviour of such devices from a clear understanding and rigorous use of basic principles Throughout the book they illustrate theoretical principles by reference to technological applications The strong emphasis on fundamentals however means that the ideas presented can be applied beyond internal flow to other types of fluid motion The book equips students and practising engineers with a range of new analytical tools These tools offer enhanced interpretation and application of both experimental measurements and the computational procedures that characterize modern fluids engineering      *The Arithmetic Teacher*, 1988      **Reviews in**

**Numerical Analysis, 1980-86**, 1987 These five volumes bring together a wealth of bibliographic information in the area of numerical analysis Containing over 17 600 reviews of articles books and conference proceedings these volumes represent all the numerical analysis entries that appeared in Mathematical Reviews between 1980 and 1986 Author and key indexes appear at the end of volume 5      **Generalized Polygons** Hendrik, van Maldeghem, 2013-11-09 This book is intended to be

an introduction to the fascinating theory of generalized polygons for both the graduate student and the specialized researcher in the field It gathers together a lot of basic properties some of which are usually referred to in research papers as belonging to folklore and very recent and sometimes deep results I have chosen a fairly strict geometrical approach which requires some knowledge of basic projective geometry Yet it enables one to prove some typically group theoretical results such as the determination of the automorphism groups of certain Moufang polygons As such some basic group theoretical knowledge is required of the reader The notion of a generalized polygon is a relatively recent one But it is one of the most important concepts in incidence geometry Generalized polygons are the building bricks of Tits buildings They are the prototypes and precursors of more general geometries such as partial geometries partial quadrangles semi partial geometries near polygons Moore geometries etc The main examples of generalized polygons are the natural geometries associated with groups of Lie type of relative rank 2 This is where group theory comes in and we come to the historical raison d'être of generalized polygons In 1959 Jacques Tits discovered the simple groups of type 3D by classifying the 4 trialitys with at least one absolute point of a D geometry The method was 4 predominantly geometric and so not surprisingly the corresponding geometries the twisted triality hexagons came into play Generalized hexagons were born
