Submarine Mass Movements and Their Consequences Sebastian Krastel, Jan-Hinrich Behrmann, David Völker, Michael Stipp, Christian Berndt, Roger Urgeles, Jason Chaytor, Katrin Huhn, Michael Strasser, Carl Bonnevie Harbitz, 2013-09-02

Submarine mass movements are a hidden geohazard with large destructive potential for submarine installations and coastal areas This hazard and associated risk is growing in proportion with increasing population of coastal urban agglomerations industrial infrastructure and coastal tourism Also the intensified use of the seafloor for natural resource production and deep sea cables constitutes an increasing risk Submarine slides may alter the coastline and bear a high tsunamogenic potential There is a potential link of submarine mass wasting with climate change as submarine landslides can uncover and release large amounts greenhouse gases mainly methane that are now stored in marine sediments The factors that govern the stability of submarine slopes against failure the

processes that lead to slope collapses and the collapse processes by themselves need to be better understood in order to foresee and prepare society for potentially hazardous events This book volume consists of a collection of cutting edge scientific research by international experts in the field covering geological geophysical engineering and environmental aspects of submarine slope failures The focus is on understanding the full spectrum of challenges presented by this major coastal and offshore geohazard
