

Cell Size

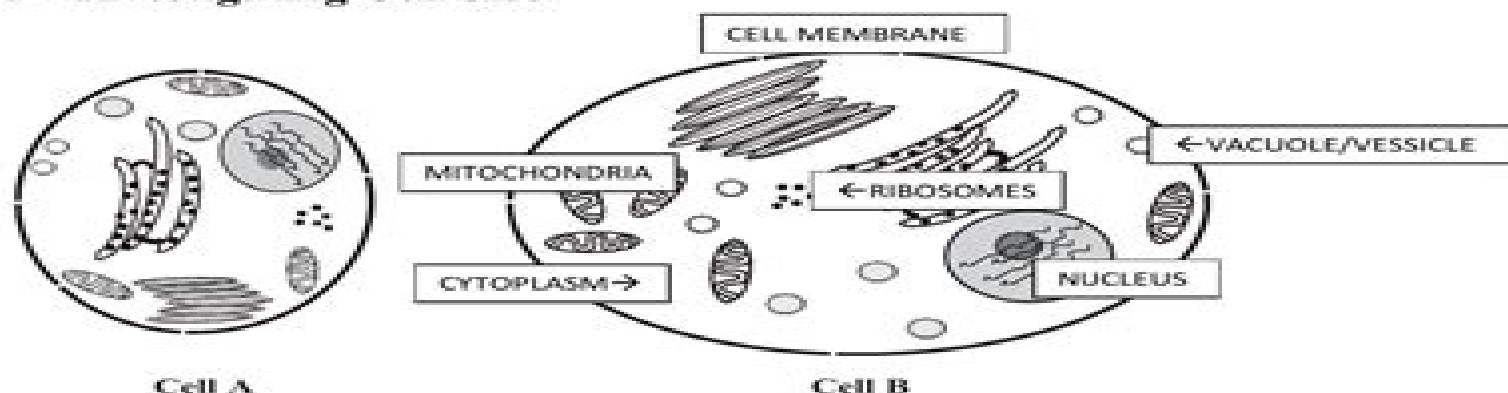

What determines the size of a cell?

Why

?

Sometimes bigger is better—tall basketball players, more closet space, and savings accounts may come to mind. What about cells? Does having big cells make an organism bigger or better? Would having larger cells be an advantage to an organism? If so, why do cells divide rather than continue growing? Maybe there is an advantage to being small.

Model 1 – Investigating Cell Size

1. Are the cells shown in Model 1 plant or animal cells? Explain your answer.

ANIMAL – NO CELL WALL, CHLOROPLAST, LARGE CENTRAL VACUOLE

2. Label Cell B in Model 1 with the following structures.

cell membrane

cytoplasm

nucleus

ribosomes

vacuole

mitochondria

3. Compare the smaller cell in Model 1 to the larger cell in Model 1.

a. Which cell has a larger surface area (more cell membrane surface)?

CELL B (LARGER CELL) HAS A LARGER SURFACE AREA THAN CELL A.

b. Which cell has more channels in its cell membrane that can transport molecules (nutrients, oxygen, and waste products) in and out of the cell?

CELL B (LARGER CELL) HAS MORE CELL MEMBRANE CHANNELS THAN CELL A.

Model 1 Investigating Cell Size:

Investigating Cellular Nanoscale with X-rays Clément Hémonnot, 2016 The advances and technical improvements of X ray imaging techniques taking advantage of X ray focussing optics and high intensity synchrotron sources nowadays allow for the use of X rays to probe the cellular nanoscale Importantly X rays permit thick samples to be imaged without sectioning or slicing In this work two macromolecules namely keratin intermediate filament IF proteins and DNA both essential components of cells were studied by X ray techniques Keratin IF proteins make up an integral part of the cytoskeleton of epithelial cells and form a dense intracellular network of bundles This network is built from monomers in a hierarchical fashion Thus the keratin structure formation spans a large range of length scales from a few nanometres monomers to micrometres networks Here keratin was studied at three different scales i filaments ii bundles and iii networks Solution small angle X ray scattering revealed distinct structural and organisational characteristics of these highly charged polyelectrolyte filaments such as increasing radius with increasing salt concentration and spatial accumulation of ions depending on the salt concentration The results are quantified by employing advanced modelling of keratin IFs by a core cylinder flanked with Gaussian chains Scanning micro diffraction was used to study keratin at the bundle scale Very different morphologies of keratin bundles were observed at different salt conditions At the network scale new imaging approaches and analyses were applied to the study of whole cells Ptychography and scanning X ray nano diffraction imaging were performed on the same cells allowing for high resolution in real and reciprocal space thereby revealing the internal structure of these networks By using a fitting routine based on simulations of IFs packed on a hexagonal lattice the radius of each filament and distance between filaments were retrieved In mammalian cells each nucleus contains 2 nm thick DNA double helices with a total length of about 2 m The DNA strands are packed in a highly hierarchical manner into individual chromosomes DNA was studied in intact cells by visible light microscopy and scanning X ray nano diffraction unveiling the compaction and decompaction of DNA during the cell cycle Thus we obtained information on the aggregation state of the nuclear DNA at a real space resolution on the order of few hundreds nm To exploit to the reciprocal space information individual diffraction patterns were analysed according to a generalised Porod's law at a resolution down to 10 nm We were able to distinguish nucleoli heterochromatin and euchromatin in the nuclei and follow the compaction and decompaction during the cell division cycle

Modern Microscopies P.J. Duke, A.G. Michette, 2013-11-11 For several decades the electron microscope has been the instrument of choice for the examination of biological structures at high resolution Biologists have become familiar with the techniques and pitfalls of sample preparation and with the interpretation of the images obtained The purpose of this book is to introduce the biologist to a number of new imaging techniques that are now becoming available to supplement and even extend the information that can be obtained from the now traditional electron microscope Some of these techniques are still at the experimental stage while others such as cryoelectron microscopy and confocal optical microscopy are at advanced stages of development and are already available commercially This book represents a first attempt to quantify the progress made by bringing together in one volume an account of the technical bases and the future potentials of the various techniques Although the content is primarily aimed at biologists microscopists in other fields should also find the information of interest and use All the chapters are written by leading experts who are at the forefront of these exciting developments About half the book is concerned with x ray microscopy the editors make no apology for this since they are both intimately involved with developments associated with this field and therefore view it perhaps with bias as being of the utmost importance
