An Integrated Approach to Home Security and Safety Systems Sonali Goyal, Neera Batra, N. K. Batra, 2021-10-14 This book provides an integrated solution for security and safety in the home covering both assistance in health monitoring and safety from strangers intruders who want to enter the home with harmful intentions It defines a system whereby recognition of a person stranger at the door is done

using three modules Face Recognition Voice Recognition and Similarity Index These three modules are taken together to provide a percentage likelihood that the individual is in the known or unknown category The system can also continuously monitor the health parameters of a vulnerable person living alone at home and aid them in calling for help in an emergency The authors have analyzed a number of existing biometric techniques to provide security for an individual living alone at home These biometric techniques have been tested using MATLAB image processing and signal processing toolboxes and results have been calculated on the basis of recognition rate A major contribution in providing security is a hybrid algorithm proposed by the author named PICA which combines features of both PCA Principle Component Analysis and ICA Independent Component Analysis algorithms This hybrid approach gives better performance recognition than either system alone The second proposed hybrid algorithm for voice recognition is named as a MFRASTA algorithm by combining features of MFCC Mel Frequency Cepstral Coefficient and RASTA PLP RelAtive SpecTrA Perceptual Linear Prediction algorithm After performing experiments results are collected on the basis of recognition rate The authors have also proposed a third technique named as a Similarity Index to provide trust based security for an individual This technique is text independent in which a person is recognized by pronunciation frequency tone pitch etc irrespective of the content spoken by the person By combining these three techniques a high recognition rate is provided to the person at the door and high security to the individual living independently at home In the final contribution the authors have proposed a fingertip based application for health monitoring by using the concept of sensors This application is developed using iPhone 6 s camera When a person puts their fingertip on a camera lens with the help of brightness of the skin the person s heartbeat will be monitored This is possible even with a low quality camera In case of any emergency text messages will be sent to the family members of the individual living alone by using 3G Dongle and MATLAB tool Results show that the proposed work outperforms all the existing techniques used in face recognition voice recognition and health monitoring alone
