

SECTION 1 Measuring Motion continued

The average speed of the dog is:

$$\text{average speed} = \frac{\text{total distance walked}}{\text{total time}} = \frac{7 \text{ m}}{10 \text{ s}} = .07 \text{ m/s}$$

What Is Velocity?

Suppose that two birds leave the same tree at the same time. They both fly at 10 km/h for 5 min, then 5 km/h for 10 min. However, they don't end up in the same place. Why not?

The birds did not end up in the same place because they flew in different directions. Their speeds were the same, but because they flew in different directions, their velocities were different. **Velocity** is the speed of an object and its direction. **53**

The velocity of an object is constant as long as both speed and direction are constant. If a bus driving at 15 m/s south speeds up to 20 m/s south, its velocity changes. If the bus keeps moving at the same speed but changes direction from south to east, its velocity also changes. If the bus brakes to a stop, the velocity of the bus changes again.

The table below shows that velocity is a combination of both the speed of an object and its direction.

Speed	Direction	Velocity
15 m/s	south	15 m/s south
20 m/s	south	20 m/s south
20 m/s	east	20 m/s east
0 m/s	east	0 m/s east

Velocity changes when the speed changes, when the direction changes, or when both speed and direction change. The table below describes various situations in which the velocity changes.

Situation	What changes
Skateboard falling faster and faster	
Runner going around a turn on a track	direction
Car taking an exit off a highway	speed and direction
Train arriving at a station	speed
Baseball being caught by a catcher	speed
Baseball hit by a batter	speed and direction

READING CHECK

B. Analyze Someone tells you that the velocity of a car is 55 m/s. Is this correct? Explain your answer.

Say It

Share Experiences Have you ever experienced a change in velocity on an amusement park ride? In pairs, share an experience. Explain how the velocity changed—was it a change in speed, direction, or both?

Ferris, Chin-Teng Lin, Scott Makeig, 2014-10-03 Decades of brain imaging experiments have revealed important insights into the architecture of the human brain and the detailed anatomic basis for the neural dynamics supporting human cognition However technical restrictions of traditional brain imaging approaches including functional magnetic resonance tomography fMRI positron emission tomography PET and magnetoencephalography MEG severely limit participants movements during experiments As a consequence our knowledge

of the neural basis of human cognition is rooted in a dissociation of human cognition from what is arguably its foremost and certainly its evolutionarily most determinant function organizing our behavior so as to optimize its consequences in our complex multi scale and ever changing environment The concept of natural cognition therefore should not be separated from our fundamental experience and role as embodied agents acting in a complex partly unpredictable world To gain new insights into the brain dynamics supporting natural cognition we must overcome restrictions of traditional brain imaging technology First the sensors used must be lightweight and mobile to allow monitoring of brain activity during free participant movements New hardware technology for electroencephalography EEG and near infrared spectroscopy NIRS allows recording electrical and hemodynamic brain activity while participants are freely moving New data driven analysis approaches must allow separation of signals arriving at the sensors from the brain and from non brain sources neck muscles eyes heart the electrical environment etc Independent component analysis ICA and related blind source separation methods allow separation of brain activity from non brain activity from data recorded during experimental paradigms that stimulate natural cognition Imaging the precisely timed distributed brain dynamics that support all forms of our motivated actions and interactions in both laboratory and real world settings requires new modes of data capture and of data processing Synchronously recording participants motor behavior brain activity and other physiology as well as their physical environment and external events may be termed mobile brain body imaging MoBI Joint multi stream analysis of recorded MoBI data is a major conceptual mathematical and data processing challenge This Research Topic is one result of the first international MoBI meeting in Delmenhorst Germany in September 2013 During an intense workshop researchers from all over the world presented their projects and discussed new technological developments and challenges of this new imaging approach Several of the presentations are compiled in this Research Topic that we hope may inspire new research using the MoBI paradigm to investigate natural cognition by recording and analyzing the brain dynamics and behavior of participants performing a wide range of naturally motivated actions and interactions
