Structural Engineering and Geomechanics - Volume 1 Sashi K. Kunnath, 2020-06-22 An understanding of dynamic effects on structures is critical to minimize losses from earthquakes and other hazards. These three books provide an overview of essential topics in structural and geotechnical engineering with an additional focus on related topics in earthquake engineering to enable readers gain such an understanding. One of the ultimate objectives of these books is to provide readers with insights into seismic analysis and design. However, in order to accomplish that objective, background material on structural and geotechnical engineering is necessary. Hence, the first two sections of the book provide this background material followed by selected topics in earthquake engineering. The material is organized into three major parts. The first section covers topics in structural engineering. Beginning with fundamental mechanics of materials, the book includes chapters on linear and nonlinear analysis as well as topics on modeling of structures from different perspectives. In addition to traditional design of structural systems, introductions to important concepts in structural reliability and structural stability are discussed. Also covered are subjects of recent interest, viz. blast and impact effects on structures as well as the use of fiber reinforced polymer composites in structural applications. Given the growing interest in urban renewal, an interesting chapter on restoration of historic cities is also included. The second part of the book covers topics in geotechnical engineering covering both shallow and deep foundations and issues and procedures for geotechnical modeling. The final part of the book focuses on earthquake engineering with emphasis on both structures and foundations. Here again, the material covered includes both traditional seismic design and innovative seismic protection. And more importantly, concepts in modeling for seismic analysis are highlighted.

The Seismic Design Handbook Farzad Naeim, 2012-12-06 This handbook contains up to date existing structures, computer applications and information on planning, analysis and design of seismic design of wood structures. A new and very useful feature of this edition of earthquake resistant building structures is the inclusion of a companion CD ROM disc for developers and students of structural engineering containing the complete digital version of the handbook itself and the following very engineering and architecture with authoritative yet practical design information. It represents an important publication, an attempt to bridge the persisting gap between UBC 1997, 2000 Structural advances in the theories and concepts of Comparisons and Cross References ICBO earthquake resistant design and their 2000 implementation in seismic design practice. 2 NEHRP Guidelines for the Seismic Rehabilitation of Buildings FEMA 273 Federal Emergency Management Agency composed of 22 experts from industry and universities recognized for their knowledge and 1997 extensive practical experience in their fields. 3 NEHRP Commentary on the Guidelines for the Seismic Rehabilitation of Buildings FEMA 274 Federal Emergency Management Agency concisely the basic principles and procedures pertinent to each subject and to illustrate with 1997 practical examples the application of these 4 NEHRP Recommended

Earthquake Resistant Engineering Structures VIII C. A. Brebbia,Michele Maugeri,2011 In order to protect the built environment in earthquake prone regions of the world It is important to retrofit and rehabilitate existing structures and infrastructure as well as to ensure the optimal design and construction of new facilities The high stakes in human life and property in urban densely populated urban areas has been driving research on advances in this field These advances are presented biennially at a conference organized by the Wessex Institute of Technology This book contains the papers from the latest conference in the series which began in 1991 The papers cover Geographical and geotechnical engineering Seismic hazard and vulnerability Seismic isolation and energy dissipation Structural dynamics Building performance during earthquakes Retrofitting Lifelines Material mechanics and characterisation Nonlinear numerical analysis Performance based design Experimental studies Safety and security and Innovative technologies **Hybrid and Composite Structures** Bahram M. Sustainable Cities Giuseppe Margani, 2019-06-11 The principle of sustainability should be strictly connected with safety since both aim to conserve resources in the case of sustainability the resources are typically thought of as environmental while in the case of safety the resources are basically human In spite of this common ground discussions on sustainability usually give insufficient attention to safety In the last years the EU has made large investments to increase the energy efficiency of the existing building stock paving the way for a low carbon future however less effort has been made to enhance its seismic resilience Therefore the safety and consequently the sustainability of towns situated in earthquake prone countries remain inadequate In such countries energy renovation actions should be combined with seismic retrofitting However a number of barriers considerably limit the real possibility of extensively undertaking combined retrofit actions especially for multi owner housing and high rise buildings These barriers are of different kinds technical e g unfeasibility and or ineffectiveness of conventional retrofit solutions financial e g high renovation costs insufficient incentives subsidies organizational e g occupants disruption and relocation renovation consensus by condominium ownerships and cultural social insufficient information and skills lack of adequate policy measures for promoting renovation actions This book aims to overcome these barriers and to bridge the gap between sustainability and safety so to conserve both human and environmental resources
